TABLE OF CONTENTS

LIST OF TABLES.....	III
LIST OF FIGURES.....	VII
LIST OF ABBREVIATIONS.....	IX
FOREWORD.....	XI
ACKNOWLEDGEMENTS.....	XIII
EXECUTIVE SUMMARY.....	XV
CHAPTER 1: OVERVIEW OF THE FIFTH RWANDA POPULATION AND HOUSING CENSUS.....	1
1.1. Context and justification.....	1
1.2. Legal and institutional frameworks.....	1
1.3. Objectives of the Census.....	1
1.4. Census phases and Methodology.....	1
CHAPTER 2: CONTEXT, OBJECTIVES AND METHODOLOGY OF THE ANALYSIS.....	7
2.1. Context.....	7
2.2. Objectives.....	9
2.3. Methodology.....	9
2.4. Definition of basic concepts.....	9
CHAPTER 3: NUMBER, SPATIAL DISTRIBUTION AND EVOLUTION OF THE HOUSEHOLDS BETWEEN 1978 AND 2022.....	13
3.1. Number and spatial distribution of private households.....	13
3.2. Evolution between 1978 and 2012 in the number and spatial distribution of households.....	15
CHAPTER 4: PRIVATE HOUSEHOLD HEADSHIP RATES BY AGE AND SEX AND BACKGROUND CHARACTERISTICS OF HOUSEHOLDS HEADS.....	17
4.1. Distribution of the head of household by sex, age and area of residence.....	17
4.2. Household headship rate by sex, age and area of residence.....	19
4.3. Background characteristics of household heads.....	21
CHAPTER 5: SIZE, TYPE AND STRUCTURE OF PRIVATE HOUSEHOLDS.....	27
5.1. Size of households.....	27
5.2. Types of private households.....	30
5.3. Structure of private households.....	37
5.4. Age Dependency ratio.....	39
CHAPTER 6: TYPES OF HABITAT, OCCUPATION ARRANGEMENTS AND HOUSING TENURE.....	41
6.1. Type of habitat.....	41
6.2. Type of building/living arrangement.....	45
6.3. Housing tenure.....	48
CHAPTER 7: PHYSICAL CHARACTERISTICS OF THE MAIN BUILDINGS USED BY HOUSEHOLDS.....	53
7.1. Main material of the walls.....	53
7.2. Main material of the roof.....	59
7.3. Main material of the floor.....	63
7.4. Residential promiscuity.....	67
7.5. The housing quality index (HQI).....	69
CHAPTER 8: HOUSEHOLDS' ACCESS TO WATER, SANITATION, HYGIENIC FACILITIES AND ENERGY.....	75
8.1. Households' access to water, sanitation and hygiene.....	75
8.2. Sources of energy for lighting and cooking.....	92
CHAPTER 9: HOUSEHOLDS' OWNERSHIP OF SPECIFIC ASSETS.....	105

9.1.	Ownership of ICT devices.....	105
9.2.	Households' access to the internet.....	108
9.3.	Ownership of means of transport.....	111
CONCLUSION		115

FOREWORD

The Government of Rwanda, through the National Institute of Statistics of Rwanda (NISR), conducted the Fifth Rwanda Population and Housing Census in August 2022. The Census results provide updated demographic, social and economic indicators for policy formulation and planning to support the national development agenda. Census results will also help in tracking the implementation of national, regional, continental and global development goals, such as the National Strategy for Transformation (NST), the AU Agenda 2063, and the Sustainable Development Goals (SDGs).

The Population and Housing Census in Rwanda dates back to the year 1978 when the first ever-modern census was implemented. The second, third, and fourth censuses were carried out in 1991, 2002, and 2012 respectively. The 2022 Rwanda Population and Housing Census marks therefore the fifth in the series following the United Nations Recommendations to conduct a census every ten years.

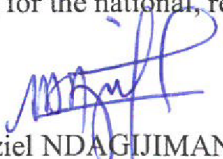

Considering census' crucial importance for the planning process, the Government of Rwanda has made the Population and Housing Census a priority to be undertaken every 10 years and adopted the use of technologies for timely delivery of census results for use.

Results of the 2022 Population and Housing Census provide population numbers from national to the lowest administrative level, as well as demographic and socio-economic indicators at both national and district levels. The census remains the only national data collection exercise that can provide the lowest levels of disaggregation to support decentralised decision making across the country.

I would like, therefore, to take this opportunity to thank all stakeholders that contributed to the success of the 2022 Rwanda Population and Housing Census. They include Ministries and other Government institutions, international organizations such as the World Bank (WB), the European Union (EU), the United Nations Population Fund (UNFPA), One-UN, UN Women, UNICEF, UNECA, the United Kingdom AID (UKAID), ONS, the African Development Bank (AfDB), the USAID, ENABEL, PARIS 21 and others for their support in diverse ways.

My special thanks go to the local government leaders from the province to the village levels who contributed a lot to the success of the 2022 Rwanda Population and Housing Census. Exceptional gratitude goes also to all enumerators and all field personnel, who collected the information and all respondents for their cooperation and dedication. The National Institute of Statistics of Rwanda (NISR) deserves special appreciation for the excellent operational and coordination of all census activities.

I finally recommend that the invaluable information contained in the different thematic reports of the 5th Rwanda Population and Housing Census be used as updated evidence for all decision and policy making for the national, regional and global development programs.

Dr. Uzziel NDAGIJIMANA
Minister of Finance and Economic Planning

ACKNOWLEDGEMENTS

The National Institute of Statistics of Rwanda (NISR) is pleased to release the results of the Fifth Rwanda Population and Housing Census (RPHC5). The execution of different Census phases: preparatory works, data collection, data processing, tabulation and data analysis; spans for a period of about four years between 2020 and 2023.

NISR has produced several thematic reports to be of direct help to policy makers, planners, local authorities and other census users. The reports provide key information, mainly population size and distribution, education, settlement, population of particular interest (children, youth, women, elderly, etc.), and population projections to mention but a few. NISR expects that results from these reports supplemented by the district profile reports will meet the demand of census data users across board.

On this occasion, I would like to extend my sincere gratitude to the Government of Rwanda and development partners for availing financial, logistical and technical support to the 2022 RPHC. The NISR would like to appreciate all stakeholders who worked tirelessly with us to ensure that the 2022 Rwanda Population and Housing Census operation was successful.

Special recognition also goes to the Ministry of Finance and Economic Planning, Ministry of Defence, Ministry of Local Government, Ministry of Education, Ministry of Foreign Affairs, Ministry of ICT and Innovation, Ministry of Interior, Ministry of Health, Ministry in Charge of Emergency Management, the Rwanda National Police, Rwanda Correctional Services, Rwanda Biomedical Center (RBC), Rwanda Information Society Authority (RISA), Rwanda Utilities Regulatory Authority (RURA), Rwanda Public Procurement Authority (RPPA), Office of Government Spokesperson (OGS), and Rwanda Broadcasting Agency (RBA) for their direct involvement in awareness campaign, logistical and data collection operations.

I also wish to express my appreciation to the local government authorities and NISR staff for their excellent operational organization and to the tens of thousands of enumerators and supervisors for their painstaking efforts throughout the data collection phase.

Finally, to the people of Rwanda, residents, and visitors, your cooperation was crucial towards the success of the census.

Thank you.

MURANGWA Yusuf
Director General,
National Institute of Statistics of Rwanda

EXECUTIVE SUMMARY

This report is one in a series of thematic reports prepared mainly from analysis of the Fifth Rwanda Population and Housing Census (RPHC5) data and aiming at improving knowledge on the social, demographic and economic characteristics of the population of Rwanda in 2022, so as to enable a better understanding of development interrelationships. This report focuses on two interrelated topics. On the one hand, it looks at the characteristics of the households and their heads, and on the other hand it looks at the characteristics of their habitat, including population settlement types, housing units, and amenities. The report is organised into 9 main chapters, the first two of which provide the reader with an overview of the Census process and the context leading up to the analysis of the Census data and the production of the report. Chapter 3 reviews the counts and spatial distribution of the private households; Chapter 4 reviews the characteristics of household heads; Chapter 5 reviews the structure of private households; Chapter 6 reviews the type of habitats, occupation arrangements and housing tenure; Chapter 7 reviews the physical characteristics of the main buildings; Chapter 8 reviews accessibility to basic infrastructures and hygienic facilities; and Chapter 9 reviews ownership of households 'assets.

Number and spatial distribution of the households, evolution between 1978 and 2022

According to the RPHC5, Rwanda accommodates a total of 3.31 million private households. About 71% of the private households are located in rural areas. The highest number of private households is observed in the Eastern Province (about 886,132) and the lowest in Kigali City (about 488,868). The average number of private households per district is 110,000. The number of private households in Rwanda has increased by 38% from 2012, it has more than tripled since the first census of 1978. The private households accommodate a population of 13,100,600 out of a 13,246,394 total population of Rwanda. The remaining 145,794 were found in institutional households.

Characteristics of heads of private households

At the national level, 71% of private households are headed by males and 29% by females. The highest percentage of female-headed households (about 32%) is found in the Southern Province. The percentage of both

male and female-headed households was found to be constant over time in Rwanda since 2012.

The age of household heads ranges from 12 to 85 and above, with around 42 being the mean age among male heads and around 51 among female heads. About 74% of the private household heads are aged between 25 and 59 while only about 1% are aged between 12 and 19. From age 45 and above, the percentage of female-headed households is higher than male-headed households.

About 73% of household heads are currently married, 12% widowed, about 12% have never been married, about 3% separated and less than 1% are divorced. About 38% of female heads are widowed. The percentage of never-married household heads is almost three times higher in urban areas.

About 23% of household heads have no education, 56% have attended primary school and about 14% and 6% have attended secondary school and university respectively. The percentage of household heads with no education is more than 2 times higher among females compared to males and is closer to double in rural areas as compared to urban areas.

Size, type and structure of private households

About 62% of private households are nuclear households while extended and composite households account for 18% and 7% respectively. One-person households represent 13% of all private households. Extended households are mostly found among female-headed households and in rural areas, composite households are mostly found in urban areas. Likewise, one-person households are more prevalent in urban areas and among female-headed households.

The demographic dependency ratio, at the National level, is 80. Demographic dependency ratio is lower in urban areas than in rural areas. At the provincial level, the highest demographic dependency ratios are observed in the Western Province (about 88) and Eastern Province (about 85), with the lowest being in the City of Kigali (about 57).

The mean size of private households is around four persons. The household size is higher in rural areas than in urban areas. On average, male-headed households are

one person larger than female-headed households. The mean household size decreased slightly from 4.5 persons in 1978 to 4.1 persons in 2022.

Type of habitats, occupation arrangements and housing tenure

About 65% of private households are found in clustered rural settlements (*umudugudu*), 15% in dispersed settlements, about 9% in spontaneous and squatter housing, 7% in modern planned urban housing and 1% in integrated model village. Households classified as part of *umudugudu* are mostly found in rural areas compared to those observed in urban areas. On the other hand, households living in spontaneous and squatter housing are predominantly observed in urban areas comparatively to rural areas (percentage is about 12 times higher).

About 89% of private households are classified as 'house occupied by one private household' while about 10% were classified as 'house occupied by several households'. However, in urban areas, the group 'house occupied by several households' is more prevalent, accounting for about 24% of the households in this area of residence. Several buildings in a compound occupied by one or several households (*urupangu*) represents about 3% of the private households in urban areas, while storey buildings occupied by one or more households are not very common, even in urban areas (about 1%).

While owner occupation still dominates housing tenure, accounting for about 72% of the private households, it has been falling consistently since 1978. Tenant occupation, currently at 22%, has been on the rise over the last decades principally in rural areas. In urban areas, half of the private households are tenant-occupied.

The 5th RPHC also captures information on dwelling ownership among private households that were not found living in their own housing unity. Almost one out of eight (about 12%) of the private households not living in their own housing unit were found to possess a residential house.

The residential house ownership among private households not living in their own housing units is slightly higher among male-headed households (nearly 14%) than female-headed households (nearly 10%).

Physical characteristics of the main buildings occupied by households

About 93% of the private households are built with walls made of sun-dried bricks with or without cement (about 36% and 31% respectively), or wood/mud with or without cement (about 8% and 18% respectively). Non-durable wall materials (cartoons, sheathing, etc.) are almost inexistent, and other type of wall materials (cement blocks, concrete, timber, etc.) are used by about 7% of the private households in Rwanda.

The great majority of the private households use either iron sheets or local tiles as their main roofing materials. Over time, the use of iron sheets appears to increase against the use of local tiles. Countrywide proportions actually went from about 60% against 39% in 2012 to nearly 74% against 26% in 2022. In urban areas, about 94% of the households use iron sheet roofs, as compared to 66% in rural areas. Local tiles are more prevalent in the Southern Province and the lowest in Kigali City and Eastern Province, while grass roofs have been almost eradicated.

About 91% of all private households have floors built of either earth (about 60%) or concrete (about 31%). In urban areas, about 59% of the households live in dwellings with floors made of cement, as compared to about 20% in rural areas. Households living in dwellings with floors made of earth are more likely to be found in rural areas (about 74%) compared to urban areas (about 28%).

Residential promiscuity relates the size of private households to the number of bed rooms in the dwellings. On average, at the national level, there are around two persons per bedroom across Rwanda's households.

Based on the Housing Quality Index (HQI), the quality of housing is better in urban areas (about 58% ranked higher on the HQI, 7% ranked lower) comparatively to rural areas (about 35% ranked higher on the HQI, 4% ranked lower). Across the different types of habitats, housing quality is better in integrated modern villages (38%-6% first and last categories respectively) than in planned rural settlements called *umudugudu* (11%-28% first and last categories respectively), but indeed the highest quality of housing is found in modern planned urban settlements (83%-1%). Kigali has the highest quality of housing of all provinces (71%-4% first and last categories respectively) and the western province has the

lowest housing quality (12%-38% first and last categories respectively).

Households' access to water, sanitation, hygienic facilities and energy

About 82% of the households collect their drinking water from improved water sources, among which public taps outside the compound (about 33%) and protected springs/wells (about 28%) are the most common sources. The percentage of households using improved drinking water sources is higher in urban areas (about 96%) than in rural areas (about 77%). Across provinces, the highest percentage of households with access to improved drinking water sources was observed in Kigali City (about 97%) and the lowest in Western Province (about 75%). Access to improved drinking water sources has increased from 51% of all households in 1978 to about 82% in 2022. As of hygienic facilities, about 92% of the private households use improved toilet facility, among which pit latrine with constructed floor slab used by one household (69%) and the one used by several households (20%) are the most commonly used toilet facilities. Although the use of flush toilet is low at national level (about 3%), a significant number of private households use that type of toilet facility in urban areas (about 11%), while the usage is very low in rural areas (less than 1%). Taking into consideration that a household shares toilet facility with members from other households, the data show that 72% of households use unshared improved toilet facility. In rural areas, the use of unshared improved toilet facility is the most common (about 78%) compared to urban areas (about 56%).

About 45% of households use the courtyard for sewage disposal while about 46% of the households use either bush (about 20%), cesspool (about 18%) or sump (about 8%). The percentage of households in rural areas using the courtyard for sewage disposal (about 53%) is more than double of the one observed among urban households (about 24%). The use of modern modes of sewage disposal (sumps, cesspools, and main sewer system) is more common in urban areas (about 59%) than in rural areas (about 20%).

The majority of households use either household compost dumping (about 51%) or household's fields/bushes (about 33%) as their main mode of waste disposal. The use of waste collection companies as main mode of household waste disposal increases among households in urban areas, becoming the most

commonly used mode of waste disposal (about 33%), while it is almost inexistent in rural areas (less than 1%).

More than half of the households in Rwanda are connected to national grid (about 53%). In urban areas, about 83% of the households are connected to the national grid compared to 40% in rural areas. The highest percentage of households connected to the national grid (about 89%) was observed in Kigali City while the lowest (about 44%) was observed in the Southern Province.

About 61% of the private households predominantly use electricity as their source of energy for home lighting (this comprises about 47% from Rwanda Energy Group (REG) or other private sources, about 14% from solar energy and less than 1% from generators). This estimate shows a substantial change when compared to the last census results, which estimated an electrification rate of the private households at about 18%. The increase is quite remarkable in rural areas whereby the use of electricity for lighting by private households actually went from about 7% in 2012 to close to 51% in 2022. Flashlight/phone flashlight is the second most used source of home lighting (about 28%). About 8% of the households either use candles (about 3%), firewood (about 4%) or lantern (about 1%) as source of energy for home lighting. The percentage of households using electricity for lighting is higher in urban areas (about 85%) than in rural areas (about 51%). The use of electricity for home lighting has increased tremendously from about 1% in 1978 to about 61% in 2022.

About 93% of the households rely on solid fuels for cooking, which includes firewood (about 76%) and charcoal (about 17%) as primary sources of energy for cooking. However, firewood is almost three times more likely to be used in rural areas (93%) than in urban areas (about 34%), while charcoal is 13 times more likely to be used in urban areas (about 50%) than in rural areas (about 4%). About 5% of the private households uses gas as main source of energy for cooking mostly in urban areas.

In order to reduce the intense consumption of biomass energy, the Government of Rwanda (GoR) is promoting the installation of energy-saving stoves in private households. However, so far only 32% of the private households currently possess these energy-saving stoves. Again firewood and charcoal are alternative sources of energy for cooking mostly used as stated by about 24% and 17% respectively.

Households' ownership of specific assets

Radios and mobile phones are the commonly found Information and Communication Technologies (ICT) devices used in Rwandan households (about 82% and 78% respectively). About 12% own a television and 4% a computer. The percentage of households with ICT devices is higher in urban areas than in rural areas. The highest percentages of households with radios and mobile phones are observed in Kigali City.

The percentage of private households with access to the internet was found to be increasing over time from about

7% in 2012 to about 22% in 2022. Homes, offices, and schools are the most commonly used places to access the internet.

About 11% of all households have a bicycle while about 2% have a vehicle or a motorcycle. The percentage of households with vehicles or motorcycles is higher in urban areas (especially Kigali City) than in rural areas. Bicycles are the most commonly transportation-related asset. The highest percentage of households with bicycles is found in the Eastern Province (about 24%).

CHAPTER 1: OVERVIEW OF THE FIFTH RWANDA POPULATION AND HOUSING CENSUS

1.1. Context and justification

The history of the Population and Housing Census in Rwanda dates back in the 1970s. To date, five modern censuses have been successfully conducted in Rwanda: 1978, 1991, 2002, 2012 and 2022.

In line with the United Nations Decennial Census Programme, the 2022 Census is the Fifth Rwanda Population and Housing Census (RPHC5) in series.

Since 2000, and following the endorsement of recommendations from major international conferences held under the auspices of the United Nations, the Government of Rwanda (GoR) has been focusing on the long-term Vision 2020 that aims at transforming Rwanda into a middle-income country. Rwanda pursued the Millennium Development Goals (2000-2015) on the international scene and currently seeks to achieve the Sustainable Development Goals (SDGs) as well as Rwanda's Vision 2050. These goals have been implemented through the medium-term planning framework of the Economic Development and Poverty

Reduction Strategy (EDPRS) and the National Strategy for Transformation (NST1). The measurement of progress in implementing national and international programmes in line with various AU and UN recommendations calls for availability of updated demographic and socio-economic statistical data to inform selected indicators at different levels.

The RPHC5 is a reliable and comprehensive source of such data. It was implemented in a way that allows the disaggregation of indicators at the lowest geographical level where it is applicable. The RPHC5 was undertaken to update the national mapping and demographic databases, to provide indicators for monitoring poverty reduction strategies and achievement of national, regional, and international development goals (NST1, Vision 2050, AU Agenda 2063, SDGs, etc.) and to strengthen the technical capacity of the National Institute of Statistics of Rwanda (NISR).

1.2. Legal and institutional frameworks

As an essential precondition for Census execution, the legislation of its operations was secured by the law No. 53bis/2013 of 28/06/2013 establishing the National Institute of Statistics of Rwanda and determining its mission, organization and functioning; and law No. 45/2013 of 16/06/2013 on the organization of statistical activities in Rwanda.

In order to ensure focused functioning during the whole period of Census execution, a Census Unit of NISR coordinated the overall implementation of the 2022 RPHC5 with support from other NISR units.

1.3. Objectives of the Census

The overall goal of the Fifth Rwanda Population and Housing Census (PHC5) is to contribute to the improvement of the quality of life of the Rwanda population by furnishing the Government and other stakeholders with relevant, reliable, and timely data and information for development planning, policy formulation and service delivery as well as for monitoring and evaluation of development programmes.

Specifically, the 2022 Rwanda Population and Housing Census has been implemented and is well placed to:

- Have increased availability and accessibility of accurate, timely and reliable data on demographic and socio-economic characteristics for evidence-

based decisions, policy formulation and monitoring and evaluation of development frameworks at national, sub-national and sectoral levels;

- Have increased knowledge of stakeholders, at all levels, on population characteristics, patterns and trends;
- Have strengthened national capacities in data collection, processing, analysis, dissemination and utilization, including geographic information system (GIS).
- Have increased utilization, at all levels, of data and information for designing, monitoring and evaluating development programmes.

1.4. Census phases and Methodology

1.4.1. Census phases

Following the preparatory phase of the Census, which consisted of the production of the project document detailing all activities, schedule and Census budget, the following technical activities were undertaken:

- Census mapping conducted between 18th October, 2020 to 15th July, 2021;
- A Pilot Census conducted between 16-30 September, 2021;
- Questionnaire and manual development;
- Census publicity and sensitization campaign;
- Recruitment and training of field staff;
- Census enumeration conducted between 16 - 30 August, 2022;

- Post Enumeration Survey conducted between 16-30 September, 2022; and
- Post-census activities, including analysis and dissemination of census results.

The success of the RPHC5 is widely attributable to the rigorous pre-census planning and robust census enumeration monitoring undertaken by the NISR as well as the remarkable support received from the Government, people of Rwanda and the generous technical and financial assistance from international development partners.

1.4.2. Census Methodology

1.4.2.1. Census mapping

Census mapping was a crucial phase of the 2022 RPHC. The purpose of the census mapping is to divide the whole country into well-delineated enumeration areas that constitute the smallest operational census units to be assigned to each enumerator during the enumeration period.

The mapping used the latest versions of technology including satellite imagery and ArcGIS software to collect and document detailed information about the administrative units of the country, including boundaries, and locations of major social GPS coordinates of housing units and economic infrastructure (schools, health centres, hospitals, markets, administrative offices, etc.). These activities were carried out together with the estimation of the population and were used for delimitation of enumeration areas (EAs) in all villages (Imidugudu) of the country.

The Census mapping operation lasted for about 9 months (from 18th October, 2020 to 15th July, 2021), which enabled the NISR to better estimate the number of staff to be recruited (e.g., enumerators, team leaders, supervisors, etc.) and all logistics for the main field data collection.

Details from the Census mapping also provided guidance for adequate planning of the other census infrastructures and facilities required for field activities.

The outcomes of the Census mapping included the production of a new sampling frame for future surveys and an updated administrative area boundary map for Rwanda. In total, the country was delineated into 24,339 enumeration areas within the current boundaries of administrative units, consisting of five provinces, 30 districts, 416 sectors and 2,148 cells and 14, 436 villages. This allows for easy compilation of census results in these administrative entities.

1.4.2.2. Pilot Census

Prior to the RPHC5, a pilot census was designed for testing the census questionnaires, other census data-collection tools, enumeration time requirements and the state-of-preparedness of the entire field work organisation of the census.

The pilot census was conducted from 16th to 30th September, 2021 on a sample of 600 EAs, including 416 randomly selected EAs across all sectors and 184 purposively selected EAs in the areas bordering neighbouring countries to Rwanda and in remote rural areas in order to test the internet connectivity, data transmission, and the availability of electricity.

The pilot census was initially planned for 16th to 30th August, 2021 just to fall one year before the main census but was postponed for one month to ensure adequate preventive measures against the spread of Covid-19.

The pilot census was a rehearsal for the actual census enumeration during which the various methods and procedures for field organisation and operations as well as the census publicity/awareness campaign, census maps production, field remote monitoring, data transmission and storage, ICT infrastructure, and data analysis were tested.

The lessons learnt from the pilot census exercise were used to revise some census procedures and instruments to ensure a smooth/successful implementation of the actual census enumeration.

1.4.2.3. Questionnaires and manuals

The questionnaires' design for the 2022 RPHC consisted of updating the questionnaires used during the 2012 census coupled with consultations with stakeholders such as planners and policymakers from different sectors, ministries, other government institutions, private sector, and government's stakeholders,... in order to collect their needs in terms of statistical data. After the development of the questionnaires and the instruction manual, the team of analysts developed questionnaire specifications to support and ensure a smooth translation of the paper based questionnaire into the CAPI questionnaire by the IT and data processing team.

The lessons learnt during the pilot census were used by the NISR to improve and finalise the census questionnaires, containing 131 variables, as well as to revise the manuals of instructions for all the census functionaries.

The questionnaires used for data collection are presented in Annex of this report. Two different types of questionnaires were administered: one for private households and one for institutional households. The

questionnaire for private households contained a person record, a household record and a mortality record. The questionnaire for institutional households contained only a person record with few questions.

1.4.2.4. Census publicity and sensitisation campaign

The success of the census is dependent upon the cooperation and participation of the entire populace. It therefore, becomes imperative to sensitize and educate the public on the importance of the census, an objective that was achieved through the implementation of the communication strategy developed for the census. A phased approach was assumed in implementing the communication strategy that includes awareness in different ways and dissemination mechanisms.

Some of the methods used for publicizing the 2022 RPHC are as below:

- a. Digital Communication Programme through websites, social media, and mobile platforms;
- b. Public Relations, events and mass communication;
- c. Traditional Advertising through mass and outdoor media;
- d. Community Mobilization (Umuganda).
- e. Radios/TVs shows communication on the census calling for the public participation.

Prior to census enumeration, a national publicity and sensitisation campaign was implemented in order to inform the public about the importance and relevance of the census (RPHC5), as well as to seek the active participation, involvement and collaboration of administrative authorities during the census enumeration.

A subtle and targeted publicity and awareness campaign was conducted before the census, which was later intensified and expanded to cover all districts and villages across.

NISR was responsible for organizing and coordinating, as well as preparing and implementing appropriate communication strategies to all communities at both national and district levels. The materials were appropriately packaged and delivered to the districts for the implementation of communication activities. In addition, the NISR coordinated and implemented communication interventions as guided by the communication strategy, and where necessary, by the prevailing conditions at the district level. Census's tasks

force at Province and District levels played an important role in the census public awareness.

The census results published including the population projections attest to the high level of cooperation of the political and administrative authorities and the effective participation of the general public in the entire census enumeration operation and processes.

1.4.2.5. Recruitment and training of field staff

The RPHC5 was conducted by personnel from various institutions: the NISR (the census executing agency), the Rwanda Defence Force through involvement of the Ministry of Defence, the Ministry of Emergency Management, the Rwanda National Police, the Rwanda Correctional Services and MINEDUC (Sector Inspectors of education and teachers).

The recruitment of Census functionaries was done by each institution according to the needs (i.e., number and categories of staff needed) of the NISR, except in the case of teachers whose recruitment was done by the NISR in collaboration with administrative authorities at the district and sector levels.

At each stage of census implementation, the necessary induction and mandatory training of NISR staff and census personnel took place. For example, the census mapping phase was preceded by the training of cartographers, while the pilot census and the actual census enumeration were preceded by the training of enumerators, data quality monitors and their supervisors.

About twelve weeks prior to the commencement of actual Census enumeration, cascaded trainings were organised for all categories of census functionaries, namely:

- a. Core training for 59 people (exclusively NISR staff);
- b. Master training for 200 master trainers (NISR staff expanded to the Data quality monitors/team leaders and special institutions national coordinators);
- c. Training of trainers for 1,748 trainers organised in 30 training centres, one centre per district; and
- d. Training of 26,536 enumerators in 445 training centres spread across all sectors of the country.

The census training sessions focused on understanding of census questionnaire content, census enumeration processes and the correct completion of census questionnaires, reading and interpretation of census

maps, practical role plays, and field practice. All the trainers and trainees were subjected to mandatory qualifying tests which they had to pass before being appointed.

In order to mitigate the risk of declining quality of training at the various cascading trainings, the training content was recorded in audio-visual materials from the studio. The recorded materials were projected in each training centre and were registered in each trainee's telephone for use in case of electricity outage or at home.

Regarding the organization of the training in each centre, four trainers were in charge of the training centre. The training in each of the centres were coordinated at the central level by NISR trainers who moderated all training sessions using CISCO Webex to ensure that all contents were covered and timely management of the sessions.

1.4.2.6. Actual census enumeration

As planned, the actual census enumeration of the population in private and institutional households was conducted across the country from 16th to 30th August 2022, immediately after the Census reference night (the night of 15th to 16th August, 2022). Although data-collection activities were carried out by well-trained enumerators, quality assurance of the Census enumeration was ensured through close supervision at various levels.

The census personnel deployed for the RPHC5 comprised the following personnel:

- a. Enumerators and support staff;
- b. Sector supervisors;
- c. Field monitors/data quality monitors and district team leaders;
- d. Field analysts, data analysts; and
- e. National coordinators.

In accordance with the instructions contained in the census manual, each personnel ensured the operations of daily census activities within their area of supervision. Enumerators were accountable for the work done on a daily basis to their sector supervisors, who monitored the progress using dashboards and field visits facilitated by two motorcycles hired to facilitate the transport of Sector Supervisors in their daily supervisory activities.

As the dashboard was accessible to all supervisors at different levels of supervision, each supervisor was expected to understand what was going on regarding the data collection and then provide explanations for any identified issues.

A team of 60 data monitors was working at NISR headquarters coordinated by 10 field analysts. They were responsible of the follow up on the progress of data collection through the dashboards in all enumeration areas. They interacted with sector supervisors on a daily basis by identifying the enumeration areas with low completion rates, and then suggesting possible solutions including redeployment of those who completed enumeration in EAs lagging behind. They were also reporting any issue that needed special attention of the coordination team.

The dashboards allowed coordination team to continually monitor the progress of census enumeration in all the 24,399 enumeration areas but also ensuring for quality of the census. The use of dashboards allowed the identification of the enumeration areas with risk of not completing the enumeration on time and where additional resources and support were needed (e.g. enumerators, means of transportation to ensure the completeness).

1.4.2.7. Post-enumeration activities

The post-enumeration activities include the Post-Enumeration Survey (PES), data processing, release of results, thematic analysis, and dissemination of census results. The use of technology at all stages of the census enabled the rapid and timely publication of the main indicators report, as well as the tabulations and summary results contained in the thematic reports and other census products.

The PES was conducted from 16th to 30th September 2022, just in one month after the main census enumeration. The aim of the PES was to assess the census coverage/completeness and quality of the census data. A total of 180 enumeration areas were sampled from all districts of the country. To assess census coverage, PES and census records were matched, a task that was carried out using data science techniques and the Python programming language. Matching is the process of checking whether records from two different data sets relate to the same household and/or person match or not.

In this work, both automatic and clerical matching methods were used.

The census dataset –stabilisation, data-processing, and data-editing processes were completed within two months, after which census data tables for all thematic reports were generated. The final results were subjected to an in-depth analysis across 18 generic themes (one of which is presented in this report) in accordance with the analysis plan developed for each theme. Census monographs for each of the 30 districts will also be produced.

1.4.2.8. Data quality assessment

An independent quality review (available as an internal report to NISR) was conducted in parallel with the thematic analysis. This investigated the work done prior, during, and after the census enumeration to maximise the level of data quality. The assessment confirmed strong planning and quality assurance throughout the enumeration. Assessment of the key demographic and socio-economic variables also confirmed the good quality of the RPHC5 data in terms of representation of the population.

The overall conclusion of the assessment is that the RPHC5 was implemented with strong quality controls and gives an excellent representation of the population of Rwanda with generally good measurement of its structure, both in terms of spread and demographic and socio-economic characteristics. The high quality of the data with respect to coverage and representation is confirmed by the results of the Post-Enumeration Survey, which measured the net coverage of the household population in the RPHC5 to be around 99% nationally with little variation across regions and by age and sex. Gross under-coverage was around 1.8% while gross over-coverage (erroneous inclusions) was around 0.2%.

The conclusion of excellent representation is also consistent with the plausible growth rate for the population over the intercensal period implied by the national results.

Some quality issues were identified on a few population characteristics. These include age heaping, particularly for ages with terminal digits 0 and 5. However, summary measures from Whipple's index, Myers' index and the UN joint score indicate comparatively some improvement and a reduction in age heaping in the 2022 Census compared

to the 2012 Census. There is also some evidence of under-reporting of infant deaths, and across other ages - hence the use of indirect methods is recommended for estimating mortality indicators.

In conclusion, there were no major quality issues identified in the 2022 Rwanda Population and Housing Census, except for some economic activity variables with

low-quality reporting. The evaluation of key demographic and socio-economic variables as well as the triangulation of the data with other sources generally confirm the excellent quality of the RPHC5. Thus, the final database of the 2022 Rwanda Population and Housing Census is of high quality.

CHAPTER 2: CONTEXT, OBJECTIVES AND METHODOLOGY OF THE ANALYSIS

As in previous Rwandan Censuses, data for the RPHC5 were collected at the household level. Two types of households were considered: private households and institutional households. Among others the data collected focus on the spatial distribution of households, the distribution of households by different background characteristics of household heads, and on housing characteristics. This chapter focuses on the context, objectives and methodology of the analysis.

2.1. Context

Since the beginning of the 20th century, Rwanda has undergone profound social, administrative, political and economic changes that have had a large impact on the society and on housing conditions.

Rwandan society is traditionally favourable to marriage and then to the formation of a nuclear family and procreation. Social relationships have been based more on nuclear, extended families and neighbourhoods. The Rwandan family has always been considered the core of life, the cradle of the future and the pillar of happiness: it is within family that a child is conceived, born, educated and offered to the community for the good of society. This is recognised by the Constitution of the Republic of Rwanda. It is also within the family that the first interpersonal relationships are tied and exchanged, comparison and identification opportunities obtained.

Rwandan society is becoming more individualistic, due to the influences of western education and economic hardship. Moreover, the roles of family members have changed, especially in regard to women, who are no longer limited to their traditional roles as wives and mothers and are nowadays required to undertake social and professional roles. Currently there are a large number of educated women who are heading public and private companies, while many others have started businesses and are less dependent upon males, especially in urban areas. Traditionally, the head of the family used to be an adult man. However, following the 1994 Genocide against the Tutsi there are now a large number of households headed by women or young people. For instance, according to SNR (2005c), 35% of household heads were female in 2002 compared to 25% in 1991 (SNR, 1994).

In terms of the patterns of human settlements and housing, the country has undergone tremendous changes

since colonisation. Before colonisation, the population lived in scattered and untidy settlements. The household was made up of one or several huts encircled with a plant enclosure. In the 1950s, Belgian colonisers initiated the villagisation policy. The first grouped villages were created in the regions surrounding the Rugezi marshland. At the same time, the Belgians started the *Paysannat* system, marked by linear scattered housings along roads in the regions around the Akanyaru valley. The villagisation policy stopped in the mid-1950s because of the political evolution (Twarabamenye, 1991), while the *Paysannat* system continued up to the late 1970s, when it was terminated due to the lack of funds and free land. In the late 1970s and early 1980s, the Government of Rwanda (GoR) attempted to re-implement *villagisation* through pilot villages in the Gashora and Sake communes, but the programme failed because infrastructure and services were not installed in the newly created villages (Bart, 1993). Simultaneously, new building materials were adopted in these schemes that led to the abandonment of grass and wood as the main building materials. The adoption of new building materials was facilitated by a rate of economic growth that provided enough financial resources to afford modern building materials such as burned bricks, iron sheets, local tiles, etc. Indeed, GDP per capita increased from USD 640 in 2012 to USD 1004 in 2022.

In the meantime, rural agglomerations emerged spontaneously around religious places, schools, health centres, markets, administrative centres, etc. and were developing in a generally haphazard manner. The GoR tried to organise such developments after the mid-1970s, recommending that all services be grouped at one site to allow for the provision of basic services such as drinking water, electricity, sanitation, etc. This was operationalised under a policy called *Plan d'Action*

Communale. However, there were few coercive measures (especially for non-government initiated services) and consequently the programme did not succeed.

The *villagisation* policy was again attempted in 1996 by the GoR with the goal of providing genocide against the Tutsi survivors and returning refugees with shelter. The programme, which was implemented by local and international NGOs, started in the Eastern Province on new land reclaimed from the Mutara Hunting Domain, and on two-thirds of the Akagera National Park. In 2000, the population residing in scattered settlements within the province were asked to move to new village sites. At the same time, in Musanze District in the Northern Province, thousands of people were advised by the GoR to settle in villages in order to be effectively protected by the national army which was fighting rebels from the Democratic Republic of Congo. Based on the success of these operations, the GoR decided that the grouped and planned settlements were to be the only settlement patterns accepted in Rwanda. This was made compulsory with the publication of the law governing land use in the Official Gazette of the Republic of Rwanda in 2005. Since then, local governments have been asked to implement this policy, although the results of such implementation vary from one province to another.

The other important change in recent decades is urbanisation. Rwanda's urbanization history is quite recent. Since the colonial and post-independence periods, the Government has promoted "ruralisation" of residents into rural areas. This policy resulted in low urban population growth, uncontrolled spatial expansion with little provision of safe, open, public places, and uncoordinated planning and provision of basic services in urban settlements. Between 1960 and 2012, the urbanization rate increased significantly, going from 2% to 16.5% while the GDP went from USD 1.68 billion to USD 7 billion (Policy Note on Rwanda National Urbanization Policy, UNHSP 2017). The first urban centres in Rwanda were military posts set up by German colonisers. Some of them stagnated or even declined while others such as Musanze, Rubavu, Rusizi and Kigali prospered. During the colonial period, the level of urbanisation remained very low due to administrative restrictions and social and religious beliefs. At the time of the country's independence in 1962, less than 1% of the Rwandan population resided in urban areas. By 2008, following the suppression by the post-1994 GoR of all restrictions on settling in urban areas, the level of urbanisation reached 18%. However, urban development has again taken place

in haphazard manner, leading to huge informal settlements (especially in the City of Kigali). This led the Government to adopt the Human Settlement Policy and National Urban Housing Development schemes in 2004 and 2009 respectively. The two policies aim at improving the living conditions of the population in rural and urban areas. Master plans and local plans for land use have been developed.

Moreover, the GoR through the National Strategy for Transformation, Medium Term Strategy (2018-2024) has been focusing to accelerating the attainment of Rwanda's Vision 2050 ambitions and global commitments. In order to achieve the high-level targets of Economic Transformation and prosperity, water and sanitation sector will contribute to targets of the NST-1 as follow: The sector aims to increase the proportion of population/households accessing improved source of water from 84.8% (EICV4) to 100% and the proportion with improved sanitation services and facilities from 83% (EICV4) to 100% (MININFRA, 2017). The national electrification plan and national Policy's approach on access to electricity stipulate that 100% of the households will have access to electricity by the year 2024. Among these households, 70% will be connected through grid extension while 30% will be connected through off-grid solutions. Moreover, the GoR has been also promoting the human settlement in the country by developing and facilitating decent settlement of Rwandans including relocation of those living in scattered settlements and high-risk zones to Integrated Development Program (IDP) model villages. The idea was born in 2010 with each of 30 districts supposed to have a model village to promote the human settlement. Another factor relevant to this thematic report is that Rwanda has experienced several administrative reforms, especially since the early 1990s. The first administrative reform was the constitution of Kigali Prefecture with three communes (Kimihurura, Kacyiru and Nyarugenge) in 1991. The second was in 1995 with the constitution of Umutara Prefecture, integrating parts taken from Byumba and Kibungo prefectures. The third took place in 2000 with the merging of communes into districts, and the prefectures becoming provinces. Based on this reform, the number of communes fell from 156 to 106 districts and 11 provinces, including Kigali City. The urban areas of respective cities/towns were also enlarged. The last administrative reform occurred in late 2005 and divided the country into four provinces (the Southern, Northern, Eastern, and Western provinces) and City of Kigali. This round of reforms brought the number of districts to 30. These

successive administrative reforms make tracing the evolution of households and housing far from straightforward, especially at the local and district levels.

2.2. Objectives

The overall objective of this report is to provide the number of households in Rwanda and to classify them by type and living conditions, giving a particular emphasis on private households. The report aims at providing evidence of the impact of a number of policies designed to improve the population's living conditions. Where possible, the RPHC5 findings will be compared with results from the previous Censuses conducted in 1978, 1991, 2002, 2012 and 2022. To this end, the report will:

- Analyse the number and spatial distribution of households and the evolution since 1978;
- Describe the main characteristics of the heads of private households;

- Analyse the size, type, structure, residential promiscuity and housing quality index (HQI) of private households;
- Describe the types of habitat and buildings occupied by private households and the tenure of the households;
- Analyse households' access to improved water sources and basic sanitation, their hygiene practices, national grid connectivity and the types of energy used for lighting and cooking;
- Examine household members' access to the internet as well as households' ownership of specific assets; and
- Analyse the living standards of households.

2.3. Methodology

In this census, the use of traditional paper and pencil techniques has been replaced by the use of computer assisted personal interviewing techniques so as to improve the speed of delivery and quality of the data. For the first time, Computer Assisted Personal Interviewing (CAPI) technique was used as the method of data collection for EICV5 in 2016/17. Since then, CAPI has been continued to be used in various surveys conducted by the

NISR. The 5th Rwanda Population and Housing Census is also the first census where the CAPI technique has been used for data collection, including the listing operations. Descriptive statistics were applied to produce tables featuring statistical counts, proportions, means and medians. Maps and graphs were produced to illustrate and highlight the key findings of the report.

2.4. Definition of basic concepts

Household: Household is defined as a socio- economic unit, consisting of individuals who live together

Private household: consists of one or more persons living together and sharing at least one daily meal. Persons in a private household may or may not be related, or may constitute a combination of persons both related and unrelated. Private households can be classified in four types: one-person households, nuclear households, extended households and composite households.

Types of private households:

According to the United Nations Statistics Division (UNSD), there are four types of private households.

- **One-person household:** consists of only one person who makes provision for his or her own food or other essentials for living without combining these endeavours with any other person.
- **Nuclear household:** refers to a single family consisting of a married or unmarried couple with or without children, single or both parents with children.
- **Extended household:** defined as a household consisting of persons related to each other and living together but who do not form a nuclear family. For example, a father with child(ren) and

other relative(s) or a married couple with other relative(s)

- **Composite household:** refers to households with persons not related to each other living together ; extended or nuclear family living with non-relatives.

Institutional household: comprises a group of persons who are being provided with institutionalised care, and includes educational institutions, health care institutions, military institutions, religious institutions, or institutions for the elderly or persons with disabilities. In the RPHC5, persons who were homeless on the night of the Census were also classified as belonging to an institutional household.

Head of household: refers to a person recognised as such by other members of the household. Every private household has one and only one household head.

Marital status: personal status of each individual in relation to the marriage laws or customs of the country and defined in the Census in five categories: *Never married:* an individual who has never been in a union; *Married:* an individual who was in marital union at the moment of the Census, legally or not; *Divorced:* an individual who has been separated from his or her spouse through a court decision, according to legislation; *Separated:* an individual who has separated temporarily from his/her spouse and is awaiting the court decision; *Widowed:* a man or a woman who has lost his or her spouse by death, not yet remarried. The marital status of all usual residents aged 12 and above is enquired about in the Census questionnaire.

Demographic dependency ratio: is measured as the ratio between those typically not in the labour force and the age group typically in the labour force. Using the national definition of working age, it is defined as the sum of persons aged 0 to 15 and elderly people aged 65 and above, divided by the population in the 16 to 64 age group, multiplied by 100. For international comparisons, age groups 0 to 14 and 65 and above are used to identify dependents.

Housing Unit: a separate and independent place of abode intended for habitation by a single household or more than one household at the time of the Census. The essential features of households are separateness and independence. An enclosure may be considered separate if surrounded by walls, fences, and so forth, and covered

by a roof so that a person or group of persons can isolate themselves from other persons in the community for the purposes of sleeping, preparing and taking their meals, and protecting themselves from the hazards of climate and environment.

Structure: for Census purposes, a structure constitutes a building used for residence purposes. A structure can contain one or more households.

Types of habitat: there are six types of habitat for private households: clustered rural settlements (*umudugudu*), Integrated model villages (Grouped and planned rural settlement equipped with development infrastructure like roads, adequate drinking water, electricity, etc and social economic services such as schools, selling points, health posts, etc), old settlements (Grouped settlement occupied by people with the same job, working for the same project, ...), dispersed/isolated habitats, Modern planned urban housing (cadastre), and spontaneous settlement and squatter habitats (squatter habitat usually refers to housing build on someone else's land or housing occupied by a person who is not the owner, such type of housing is negligible in Rwanda).

Housing tenure: refers to legal occupation of the dwelling. Usually, occupancy here is defined as owner, tenant, hire purchase, free lodging, staff housing or refugee/temporary camp settlement.

Room: a space in a household enclosed by walls reaching from the floor to the ceiling or roof covering, or to a height of at least two metres, of an area large enough to hold a bed for an adult (i.e. at least four square metres).

Bedroom: a room equipped with a bed and used for night rest.

Energy-saving stove: refers to a unit commonly known as '*Rondereza*' mainly made from clay soil, grass and sand. It is used to restrain the high levels of consumption of fuel wood/charcoal which leads to deforestation.

Sewage disposal: refers to the system of collecting waste water. It includes sumps, courtyards, rivulets/trenches/channels, main sewers, and cesspools.

Improved source of water: According to the latest definitions from the WHO/UNICEF Joint Monitoring Programme for water supply, sanitation and hygiene (JMP, 2017), improved sources of drinking water include: piped water (into dwelling, compound, yard or plot, to

neighbour), public tap/standpipe, tube well/borehole, protected well, protected spring, rainwater collection, and packaged or delivered water. Contrary to the previous definition of MDGs, packaged water (bottled water and sachet water) and delivered water (tanker truck and cart with small drum/tank) are treated as improved water sources according to SDGs definition.

Unimproved source of water: Any other source of drinking water which does not belong to the types of water defined above as improved is classified as unimproved source. This includes the following: unprotected well, Unprotected spring, surface water (river, lake, dam, pond, stream, irrigation channel, etc.).

Beyond the classification of sources of water as improved or unimproved, the SDG monitoring framework for water supply also measures access to basic services and access to safely managed services.

Basic water service: improved source of water which is accessible on premises (within the dwelling, plot or yard) or for which collection time is no more than 30 minutes round trip from the dwelling, including queuing time.

Limited water service: improved source, where collection time exceeds 30 minutes for a roundtrip including queuing time.

Safely managed water service: basic water service with water available when needed (continuously and in a sufficient quantity) and water is free from contamination.

Improved sanitation facility: an improved sanitation facility is defined as one that hygienically separates human excreta from human contact. According to the latest definitions from the WHO/UNICEF Joint Monitoring Programme (JMP, 2017), improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets.

Unimproved sanitation facility: unimproved sanitation facilities include the following: flush to open drain, Flush to unknown place, pit latrine without slab/open pit, hanging toilet/hanging latrine, bucket latrine, Open defecation.

Open defecation: disposal of faeces in fields, forests, bushes, open water bodies of water, beaches or other open spaces, or with solid waste.

Basic sanitation service: improved sanitation facility which is private, not shared with other households.

Limited sanitation service: improved sanitation facility which is shared with other households.

Safely managed sanitation service: basic sanitation services meets the following criteria: (1) improved pit latrines and septic tanks that is never emptied (or don't know if ever emptied) or is emptied and excreta is buried in a covered pit (safely disposed in situ); (2) improved pit latrines and septic tanks from which excreta is removed by a service provider to treatment plant, which treatment plant is either a wastewater treatment plant providing at least secondary treatment, or a faecal sludge treatment plant that treats both the liquid and solid fractions.

Clean fuels and technologies for lighting: clean fuels and technologies for lighting include electricity, solar lantern, rechargeable or battery powered flashlight, torch or biogas lamp.

Clean fuels for cooking: as per the monitoring framework of SDG goal 7, clean fuels for cooking include the following: electricity, solar energy, LPG (Liquefied Petroleum Gas), biogas, ethanol, methanol and liquid fuel.

Solid fuels for cooking: solid materials burned as fuels for cooking, which includes coal as well as solid biomass fuels (wood, animal dung, crop wastes and charcoal).

CHAPTER 3: NUMBER, SPATIAL DISTRIBUTION AND EVOLUTION OF THE HOUSEHOLDS BETWEEN 1978 AND 2022

The number of private households is dynamic simply because a country's population is also dynamic. The changes take place both in urban and rural areas. The distribution of private households allows for a comparison to be made between administrative units and areas of residence. Data on households provide some patterns that allow the identification of contrasts between urban and rural areas. It is also used for many planning purposes. The analysis in this chapter focuses mainly on the distribution of private households by household types and area of residence.

3.1. Number and spatial distribution of private households

The 5th Rwanda Population and Housing Census, reveals that there are about 3.31 million private households in Rwanda. As one would expect, Table 3.1 shows that most of the private households (about 71%) are located in rural areas and that they comprise almost a similar percentage of the total population.

Table 3.1 also shows that the number of private households varies considerably across provinces. The highest number of private households is observed in the Eastern Province (about 886,132) and the lowest in the City of Kigali (about 488,868). In general, a larger share of private households lives in rural areas and represents a larger share of the resident population, the City of Kigali, where about 89% of the 489,000 private households live in urban areas, is an exception to this trend. In other provinces outside the City of Kigali, the highest percentages of private households located in urban areas are observed in the Western (about 22% of

671,000 households) and Eastern Provinces (about 21% of 886,000 households) and the lowest in the Southern Province (about 15% of 760,000 households).

It is important to note that Table 3.1, and indeed, this entire report distinguishes private households inhabited by usual residents and private households including those occupied by temporary residents. The numbers differ slightly. In fact, during the 5th Rwanda PHC enumeration, some of the dwellings were found to be occupied solely by temporary residents. Though the persons living in such arrangements constitute a private household, these households (about 37,206 nationwide) will be excluded from the final count in order to avoid double counting. The actual number of private households is equal to the number of private households occupied by at least one usual resident.

Table 3.1: Distribution (count) of private households and their resident population by province and area of residence

Province and Area of Residence	Private Households ¹ (including those occupied only by visitors)		Private Households with one or more usual residents		Resident population (Private Households) ²

Table 3.2 shows that, the number of private households varies greatly across districts. On average, there are about 110,000 private households per district. Gasabo, Nyagatare and Bugesera are the districts with the highest number of private households (about 249,000 households, 160,000 households and 138,000 households, respectively), while the lowest number of private households is observed in Nyaruguru, Nyabihu and Rutsiro (about 74,000 households, 76,000 households and 87,000 households, respectively).

3.2. Evolution between 1978 and 2012 in the number and spatial distribution of households

As shown in Table 3.3 and Figure 3.1, the number of private households has changed dramatically since 1978; in a nearly 45-year period, the number of private households has increased by more than three times. The increase was particularly marked between 1978 and 1991, between 2002 and 2012 and between 2012 and 2022, with intercensal growth of about 42%, 37% and 38% respectively.

Table 3.3: Evolution between 1978 and 2022 in the number of private households and intercensal growth rate

Year	Number of private households	Intercensal growth rate (in %)
1978	1,055,950	-
1991	1,502,153	42.30%
2002	1,757,426	16.00%
2012	2,406,176	37.00%
2022	3,312,743	37.68%

CHAPTER 4: PRIVATE HOUSEHOLD HEADSHIP RATES BY AGE AND SEX AND BACKGROUND CHARACTERISTICS OF HOUSEHOLDS HEADS

Demographic and socio-economic data collected at the household level is a useful source of information for policy-makers and planners for strategic planning because changes at this level may have an impact on the country's development. Information on the heads of private households is also important as it can inform about households' living conditions, including the characteristics of households. This chapter focuses on the characteristics of private household heads. It starts by reviewing the distribution of private household heads by sex, age and area of residence and the evolution since 1978 and, then, presents a profile of household heads by selected background characteristics such as marital status, sex, educational level and economic activity status. Particular attention is given to female-headed households, first because they are considered more likely to be vulnerable than their male-headed counterparts but also because their behaviour tend to be different.

4.1. Distribution of the head of household by sex, age and area of residence

Table 4.1 presents the distribution of private households by sex of the head, province and area of residence. It shows that, about 71% of private households, at the national level, are headed by males and about 29% are headed by females. When areas of residence are considered, the percentage of male-headed households is higher in urban areas (about 74%) than in rural areas (about 70%). At the provincial level, the highest percentage of male-headed households is found in the City of Kigali (about 76%) and the lowest in the Southern Province (about 68%). The predominance of male

headship is, among other factors, related to cultural aspects in the Rwandan society, whereby the husband or the oldest male in the household is considered as the household head irrespective of whether he is the primary source of income in the household, his authority or his fulfilment of other duties usually relevant to the household head. This leaves females to become the heads of households only in particular circumstances, such as widowhood, separation or divorce, mental incapacity, imprisonment, migration of the husband, etc.

Table 4.1: Distribution (% and count) of private households by sex of the household head, province and area of residence

Figure 4.1 presents the distribution of private households by female heads and Provinces. It shows that, the highest percentages of female-headed households are found in the Southern Province (about 32%), and in the Eastern and Western Provinces (about 30% in each Province) and the lowest is in the City of Kigali (about 24%). A disaggregation of the data by area of residence reveals that, the percentage of female-headed households is higher in rural areas (about 30%) than in urban areas (about 27%).

Figure 4.1: Percentage of female-headed private households by province and area of residence

Source: 5th Rwanda Population and Housing Census.

Table 4.2 and Figure 4.2, presenting the evolution in the percentage of households headed by females since 1978, shows that the percentage of households headed by females did not change between 1978 and 1991. However, during the period between 1991 and 2002, the percentage of households headed by females increased considerably to reach about one-third of all private households in the country (see Figure 4.2). This evolution is probably related

to the impact of the 1994 genocide against the Tutsi and its aftermath. The decrease observed in the percentage of female-headed households in the period between 2002 and 2012 might be the beginning of a return to the situation observed in 1978-91. The data shows that, the percentage of households headed by females almost remains unchanged between 2012 and 2022.

Table 4.2: Evolution between 1978 and 2022 in the percentage of households headed by females

Year	Percentage of households headed by female		
	Urban	Rural	Rwanda
1978	20.6%	25.4%	25.2%
1991	21.8%	25.2%	25.0%

4.2. Household headship rate by sex, age and area of residence

Figure 4.3 presents household headship rates by age and area of residence. It shows that, in general, private household headship increases along with age. This means that the older the age of an individual, the higher is his or her chance of being a household head. However, when the area of residence is considered, each area displays different characteristics. First, headship rates in urban areas are higher than in rural areas between the ages of 12 and 64, although on average they increase at a relatively similar rate (from 2% to 75% in urban areas and

from 1% to 73% in rural areas). Second, between the ages of 65 and 69, headship rate is distributed similarly for both urban and rural areas (about 77%). Then, from 70 years and above they reduce from about 78% to 65% in urban areas. In contrast, headship rates in rural areas increase consistently between the ages of 70 and above (from about 80% to 86%). As a result, from 70 years onwards headship rates are higher in rural areas than in urban areas.

Figure 4.3: Household headship rates among private households by age and area of residence

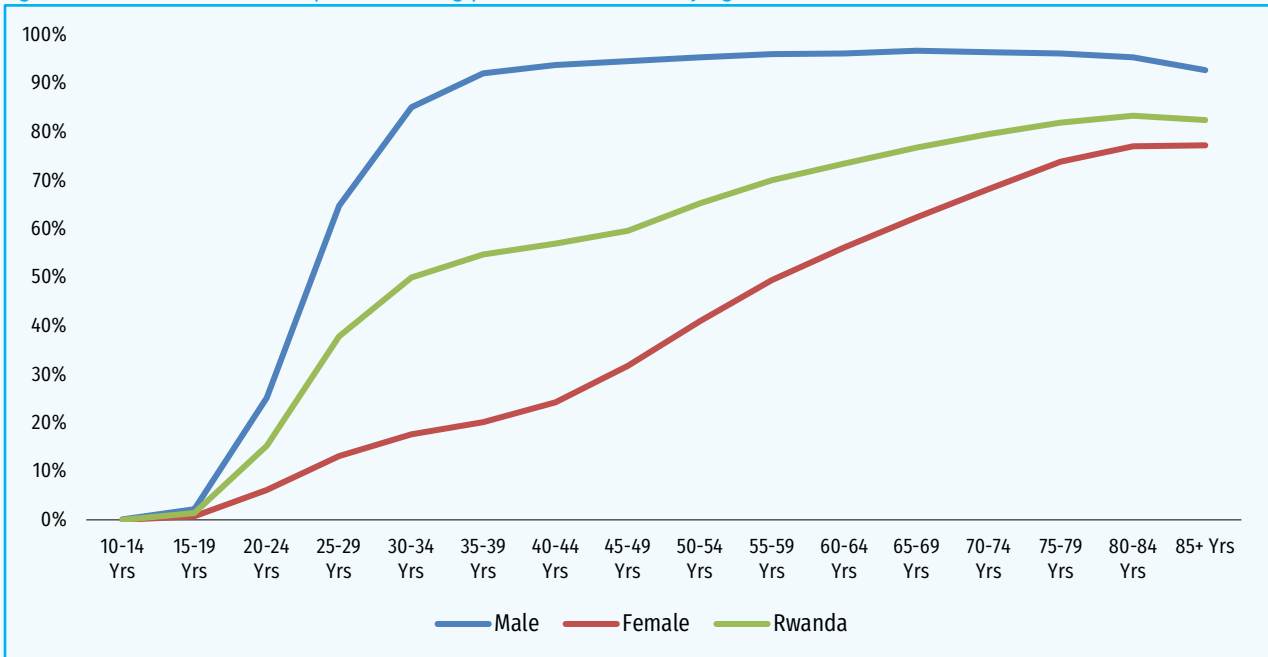

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.1 for more details.

Figure 4.4, presenting private household headship rates by age and sex, shows that when sex is considered, headship rates display sharper contrasts than those observed for areas of residence. Headship rates among male-headed households increase faster between the ages of 15 and 39 (increase from about 2% to 92%). Then, they slow down and stabilise. By contrast, headship rates

among female-headed households increase at a relatively slower pace among young people (from about 1% at the ages between 15 and 19 to about 18% at 30 to 34). Subsequently, they accelerate thereafter to reach the highest value of about 77% at between the ages of 80 and above.

Figure 4.4: Household headship rates among private households by age and sex

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.1 for more details.

4.3. Background characteristics of household heads

Figure 4.5 presents the distribution, at the national level, of private household heads by age and sex. It shows that the distribution of male household heads is asymmetric, while that of female household heads is symmetric. As a result, the percentage of male household heads is higher between the ages of 12 and 44 years while that of female household heads is higher from the age of 45 and above. This means that the percentage of households headed by individuals aged 60 and above is also higher among female heads than male heads. Finally, the percentage of

households headed by younger individuals (aged between 12 and 19), at about 1% in each case, is very low. This is to be expected as the legal age of marriage in Rwanda is 21 years, although people below this threshold can be authorised to get married under some particular circumstances. Moreover, young children, especially when they are orphans, are usually hosted in relatives' households until they reach the age of 18, at which age they are considered adults.

Figure 4.5: Distribution of household heads by age and sex

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.3 for more details

Figure 4.6 and Figure 4.7 present the distribution of household heads by age, sex and area of residence. Findings displayed in Figure 4.6 shows that the age-sex distribution of household heads in rural areas is similar to the one observed at the national level, with a higher

percentage of male household heads being found at ages between 12 and 44 and a higher percentage of female household heads found from the age of 45 and above. Again, the percentage of household heads aged 60 and above is higher among female heads.

Figure 4.6: Distribution of household heads by age and sex in rural areas

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.3 for details.

Figure 4.7 shows that, in urban areas, while the age–sex distribution of male household heads resembles the one observed at the national level, this is not the case with the distribution of female household heads. This time, it is no longer symmetric and presents a pattern closer to the one observed for male heads. However, the key differences observed before remain: the percentage of male household heads, although less accentuated,

remains higher at ages between 25 and 49 years and the percentage of female heads is higher from the age of 50 and above. The percentage of household heads aged 60 and above also remains higher among females (about 11% compared to 3%). In brief, male household heads tend to be younger than female household heads and this is more pronounced in rural areas.

Figure 4.7: Distribution of household heads by age and sex in urban areas

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.3 for more details.

Table 4.3 shows that the mean age of private household heads, at the national level, is 45 years. When the sex is considered the mean age is 42 among males and 51 among females, thus confirming the findings discussed earlier in this section of the report. When the areas of

residence are considered, the mean age of household heads for both sexes is higher in rural areas (about 43 for males and about 54 for females) than in urban areas (about 39 for males and 44 for females).

Table 4.3: Mean age of private household heads by sex and area of residence

Area of residence	Male Headed HHs	Female Headed HHs	Both Sexes
Rwanda	42.0	51.1	44.6
Urban	38.9	44.3	40.3
Rural	43.3	53.6	46.4

Source: 5th Rwanda Population and Housing Census.

Table 4.4 and Figure 4.8 show that, at the national level, the mean age of male household heads decreased slightly between 1978 and 2012 and then increased in 2022 while the mean age of female household heads increased since 1978. In rural areas, for both sexes, the mean age decreased between 1978 and 1991, and then increased.

Conversely, in urban areas, the mean age of male and female household heads has been decreasing between 1978 and 2012 and then increased in 2022. This evolution in urban areas may be related to the impact of massive rural–urban migration that has channelled young people toward urban areas since the late 1970s.

Table 4.4: Evolution between 1978 and 2022 in the mean age of private household heads by sex and area of residence

Area of residence	Mean age of household heads									
	Male					Female				
	1978	1991	2002	2012	2022	1978	1991	2002	2012	2022

Figure 4.8: Evolution between 1978 and 2022 in the mean age of private household heads at national level

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002, 2012 and 2022.

Table 4.5 which presents the distribution of household heads by marital status, sex and area of residence, shows that at the national level about 73% of household heads are married, 12% widowed, 12% have never been married and about 4% are separated or divorced. It also shows that the percentage of household heads that have never been married is almost three times higher in urban areas than in rural areas (about 21% and 8% respectively) while the percentage of household headed by widowed heads in rural areas is double of the one observed in urban areas (about 14% and 7% respectively). It is common to find many young urban residents sharing households as well as single adults hosting relatives. While widowhood among household heads is more common in rural areas, this phenomenon affects almost exclusively females.

Across all Rwanda, there are 19 times more female household heads who are widowed than their males while, in urban areas, this is even much higher; the proportion of female household heads who are widowed is more than 24 times higher than their male counterparts. The high prevalence of female household heads that are widowed is a common feature in Rwanda as widowed females hardly ever get remarried. Moreover, the data reveals that, the percentage of currently married heads is higher among male household heads (about 87%) than among their female counterparts (about 38%). When areas of residence are considered, this trend is more pronounced among rural residents than among urban residents (about 75% and 68% respectively).

Table 4.5: Distribution (%) of the private household heads by current marital status by sex and area of residence

Table 4.6 presents the distribution of private household heads by education and area of residence. It shows that, across all Rwanda, about one-quarter of private household heads have no education, more than half have attended either pre-school or primary school, and that about one-fifth attended either lower, upper secondary school or university. When areas of residence are considered, Table 4.6 reveals a clear advantage for urban areas in comparison with rural areas. The percentage of household heads with no education in rural areas is more than double compared to the one observed in urban

areas, while the percentage of those who have received either lower, upper secondary or university education reduces four times in rural areas compared with urban areas. Data also shows that, the proportion of female household heads with no education is more than double of the male household heads. On contrary, the percentage of household heads who have lower, upper secondary school and university is higher among the male household heads (about 22%) than their female counterparts (about 13%).

CHAPTER 5: SIZE, TYPE AND STRUCTURE OF PRIVATE HOUSEHOLDS

The analysis of the size, type and structure of private households is interesting to policy-makers and social services for various reasons. First, data on the size and composition of households provide an indication of some societal norms, such as those relating to childbearing, kinship among persons in the household, etc. Second, they provide information on households' living conditions. For instance, female-headed households are usually considered to be more vulnerable than male-headed households, while larger households with fewer employed persons tend to be more vulnerable to poverty than smaller households.

This chapter focuses on these topics and is organised into three sections. First, it starts by reviewing the distribution of private households by their size, area of residence and sex of the household head. Second, it reviews the types of private households in the country, highlighting the most common types according to area of residence and sex of the household head. Then, it reviews variation in these types by background characteristics of the household head, such as age, marital status, education and economic activity status. Finally, it reviews the structure of households by addressing topics such as the existence of specific population groups in households.

5.1. Size of households

The number of individuals constituting a household, commonly referred to as the household size, is a key indicator often associated with the household's living standards. Smaller household size is generally regarded as a common characteristic of less poor households.³ In Rwanda, the mean size of the private households is 4.1 individuals.

Figure 5.1 and Figure 5.2 present the distribution of private households by area of residence and sex of the household head respectively. Figure 5.1 shows that the size of private households in Rwanda ranges between one to over 15 people per household. At the national level, about 12% and 13% of households are constituted by one and two individuals respectively, while the most

common size of a household varies between three and five individuals (about 51%). From this point, the percentage of households drops substantially up to nine persons and thereafter, it falls at less than 1%. When the area of residence is considered, the distribution of households by size in rural areas is similar to the one observed at the national level. The percentage of households constituted by one and two individuals is higher in urban areas (17% and 14%), compared to rural areas (10% and 13% respectively). The proportion of households with size ranging between three and seven persons is higher in urban areas than in rural areas. Above eight persons the percentage of households decreases gradually from 4% to nearby 0%.

³ NIRS (2017), The evolution of poverty in Rwanda from 2016 to 2017: Results from the household surveys (EICV).

Figure 5.1: Distribution (%) of private households by number of resident members (household size) and area of residence

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.4 for more details.

Figure 5.2 shows that the percentage of households with between one and four members is higher among female-headed households, but with more members it subsequently stays consistently below the percentage observed among male-headed households.

Figure 5.2: Distribution (%) of private households by household size and sex of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.4 for more details.

Based on the results presented in Figure 5.3, households tend to be slightly larger in rural areas and among male-headed households. On average, male-headed households are one individual larger than female-headed ones. This may be due to the absence of the spouse in female-headed households, since most of such

heads (about 13%) are currently either widowed or divorced and they tend to take up this role at an older age following the absence of their spouses. Figure 5.3, presenting

the mean household size by province and sex of the household head, shows that in all provinces and city of Kigali, the mean size of female headed households is smaller (between 3.3 and 3.5) than the ones male headed (between 3.8 and 4.8) and the size of households male

headed is higher than the national mean size (4.1). Among male-headed households the highest values were observed in the Western and Northern provinces (4.8 and 4.5 members per household respectively) and the lowest in the City of Kigali (3.8 members per household).

Figure 5.3: Mean household size among private households by province and sex of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.5 for more details.

Table 5.1 and Figure 5.4, presenting the evolution of the mean size of households since 1978, shows that, at the national level, the mean size of the household has reduced slightly from 4.5 members per household in 1978 to 4.1 in 2022, although a slight increase was observed from 1978 to 1991.

Table 5. 1: Evolution between 1978 and 2022 in the mean size of household by area of residence

Area of residence	Household size				
	1978	1991	2002	2012	2022
Rwanda	4.5	4.7	4.5	4.3	4.1
Urban	4.4	4.3	4.6	4.1	3.9
Rural	4.6	4.7	4.5	4.4	4.1

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002 and 2012.

Figure 5.4: Evolution between 1978 and 2022 in the mean size of household by area of residence

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002 and 2012.

5.2. Types of private households

Figure 5.5 presents the distribution of the resident population in private households by their relationship to the household head. It shows that, across all over the country, households are mainly composed of the head (about 25%), spouse (about 15%) and their children (about 49%). Other relatives found in households, including the household head's parents, siblings and grandchildren, represent about 8% of the resident population in private households while non-relatives

represent just about 2%. However, when the area of residence is considered, the percentage of non-relatives is five times higher in urban households (5%) than in the rural ones (1%). When the sex of the population is considered, apart from being sons or daughters, males are most likely to be household heads (about 23% of the male population) while females tend to be spouses (about 20% of the female population).

Figure 5.5: Distribution (%) of resident population in private households by relationship to household head, area of residence and sex

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.8 for more details.

These findings are particularly important, considering that private households are classified according to the relationship of other members to the head of the household into four categories: one-person households, nuclear households, extended households and composite households (see section 2 of this report for further detail on this classification). From this, one can quickly conclude that households in Rwanda are mostly nuclear.

Figure 5.6, presenting the distribution of households by household type, area of residence and sex of the household head, shows that about 62% of private households across all Rwanda are nuclear households. About 18% are extended households while 7% and 13% are composite and one-person households respectively. When the areas of residence are considered, the data reveals that, nuclear households are less frequent in an

urban setting than in a rural one. The percentage of nuclear households reduces from about 67% in rural areas to about 50% in urban areas. On the other hand, composite and one-person households are more common in urban areas than rural areas, at almost five and two times respectively. Nuclear households are also less found among female-headed households compared to male households; the percentage of nuclear households reduces from about 68% among male-headed households to 46% among female-headed households. This gap in the percentage of nuclear households is compensated for by a higher percentage of extended households among female-headed households. In fact, the percentage of extended households is more than double among female-headed households (31%) compared to the one observed among male-headed households (13%).

Figure 5.6: Distribution (%) of private households by household type, area of residence and sex of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.9 for more details.

Table 5.2, presenting the distribution of private households by type and province, shows that this distribution follows the patterns observed by area of residence (see Figure 5.6 above). Consequently, City of Kigali, the main urban centre in the country, bears a

resemblance to urban characteristics and other provinces the rural characteristics. Hence, while the lowest percentage of nuclear households is found in the City of Kigali (about 44%), the highest percentage of composite households (about 22%) is also found there.

Table 5.2: Distribution (%) of the private households by household typology/living arrangement by sex of the household head and province

Figure 5.7 through Figure 5.12 display a review of variations in household type across selected household head characteristics, such as age, marital status and education. In some cases the data will be disaggregated further by area of residence and sex of the household head to highlight how key features observed at the national level vary according to these aspects. Figure 5.7, presenting the distribution of private households by household type and age of the household head, shows that nuclear households are the norm when the household head is aged between 20 and 24 years of age (about 55%) and between 55 and 59 (about 52%). Between these two age groups the percentage of nuclear households increases to reach the highest value of about 78% when the household head is aged between 35 and 44. However, it then starts decreasing significantly to reach its lowest levels when the household head is aged between 65 and 69 (about 31%) and 85 and above (about 20%). From the point where the percentage of nuclear households reaches its peak (i.e. when household heads

are aged between 35 and 44 years), households start transitioning to an extended type of living arrangement by taking in other relatives. The percentage of extended households increases around 3 times from about 14% at that point to 48% when household heads are between 70 and 74 years of age, stabilising at around 47% to 41% thereafter. From about the same point referred to before (when household heads are aged between 35 and 44 years), one-person households display a similar pattern. This set-up increases five times from about 7% (when the household heads are aged between 35 and 44) to about 34% (when household heads are 85 and above), suggesting that as the household head gets older his/her likelihood of living alone increases. However, the highest percentages of one-person households were observed among household heads aged between 12 and 14 (about 54%) and between 15 and 19 (about 47%), meaning that almost between one in every two individuals aged between 12 and 19 tend to live alone.

Figure 5.7: Distribution (%) of private households by household type and age of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.10 for more details.

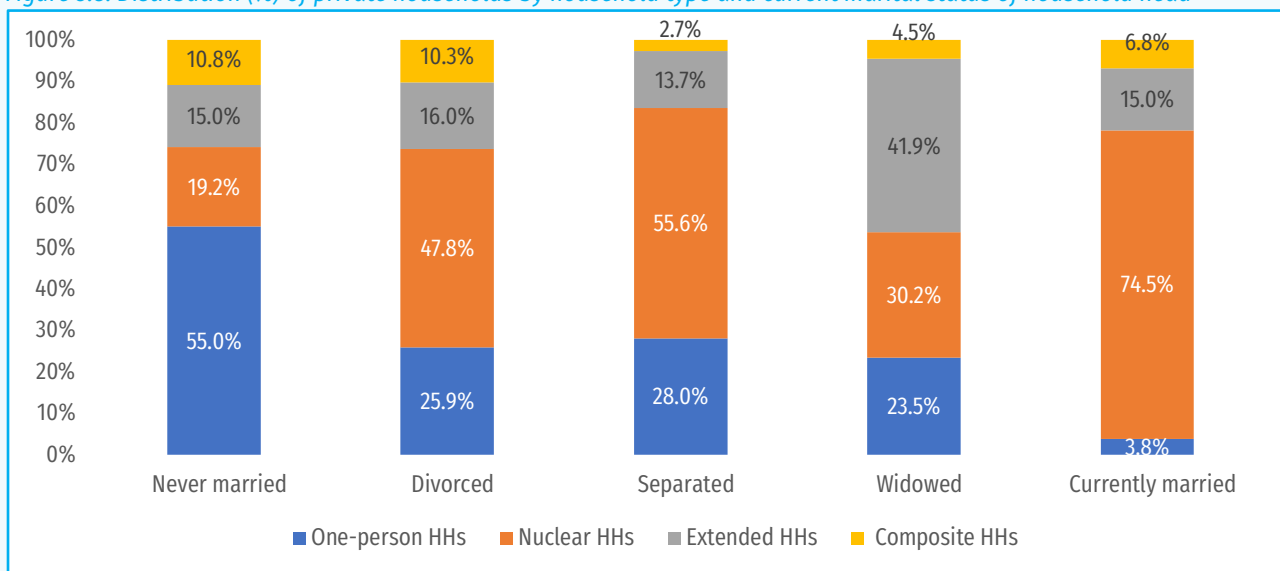

Figure 5.8 presents the distribution of private households by household type and the current marital status of the household head. The figure shows that one-person households are more common among household heads that have never been married than among heads with all other marital statuses. In fact, the percentage of one-person households reduces around 14 times from those that never married (about 55%) to those who are

currently married (about 4%). On the contrary, nuclear households are more common among household heads who are currently married than among heads with other marital statuses, notably those that never married. The percentage of nuclear households reduces about four times from heads currently married (about 75%) to heads that never married (about 19%).

Furthermore, the prevalence of composite households is also relatively higher among households headed by individuals that have never been married or divorced. This means that about one over ten households headed by an individual that has never been married or divorced tends to live with non-relatives. Finally, households headed by people who are widowed are more likely to be

extended than households headed by individuals currently in other marital statuses. Two over five households headed by widowed individuals are classified as extended households, which represents at least double the percentage observed among households headed by individuals with other marital statuses.

Figure 5.8: Distribution (%) of private households by household type and current marital status of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.13 more details.

Figure 5.9 presents the distribution of private households by household type, current marital status of the household head and area of residence. While it confirms that composite households are more common in urban areas than in rural areas (see also Figure 5.6), it reveals

that for some categories of the private households (such as those headed by individuals currently separated) the percentages are substantially below the national average both in urban and rural areas.

Figure 5.9: Distribution (%) of private households by household type, current marital status of household head and area of residence

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.14 for more details.

Figure 5.10, presenting a similar analysis by sex of the household head, also confirm that the percentage of extended households is higher among female-headed households than their male counterparts.

Figure 5.10: Distribution (%) of private households by household type, sex and current marital status of household head

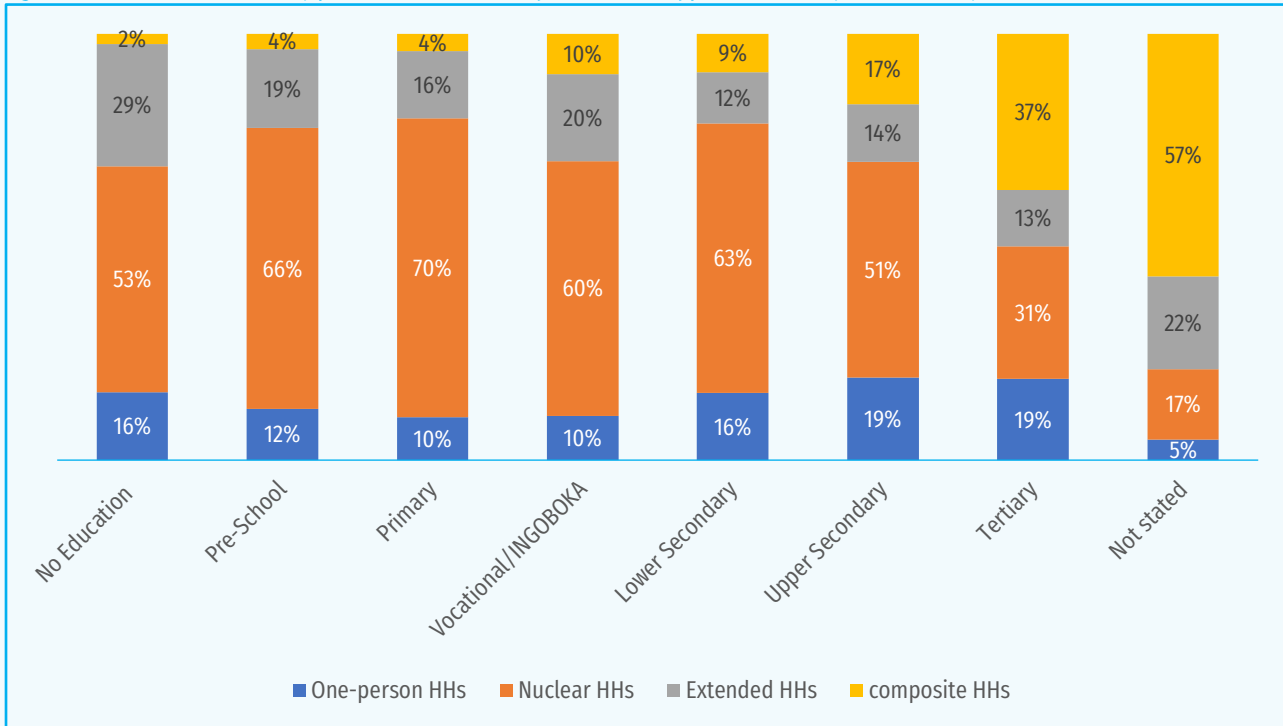

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.13 for more details.

Figure 5.11 and Figure 5.12 present the distribution of private households by household type and education of the household head. Figure 5.12 disaggregates the data further by sex of the household head. The predominance of composite households increases substantially with the level of education of the head while that of nuclear households decreases. The percentage of composite households increases just nine times from households headed by individuals that attended primary school

(about 4%) to households headed by individuals that attended university (about 37%). Conversely, the percentage of nuclear households decreases almost three times from households headed by those that attended primary school to those who attended university. Extended households seem to be particularly prominent among households headed by individuals that never attended school.

Figure 5.11: Distribution (%) of private households by household type and level of education of household head

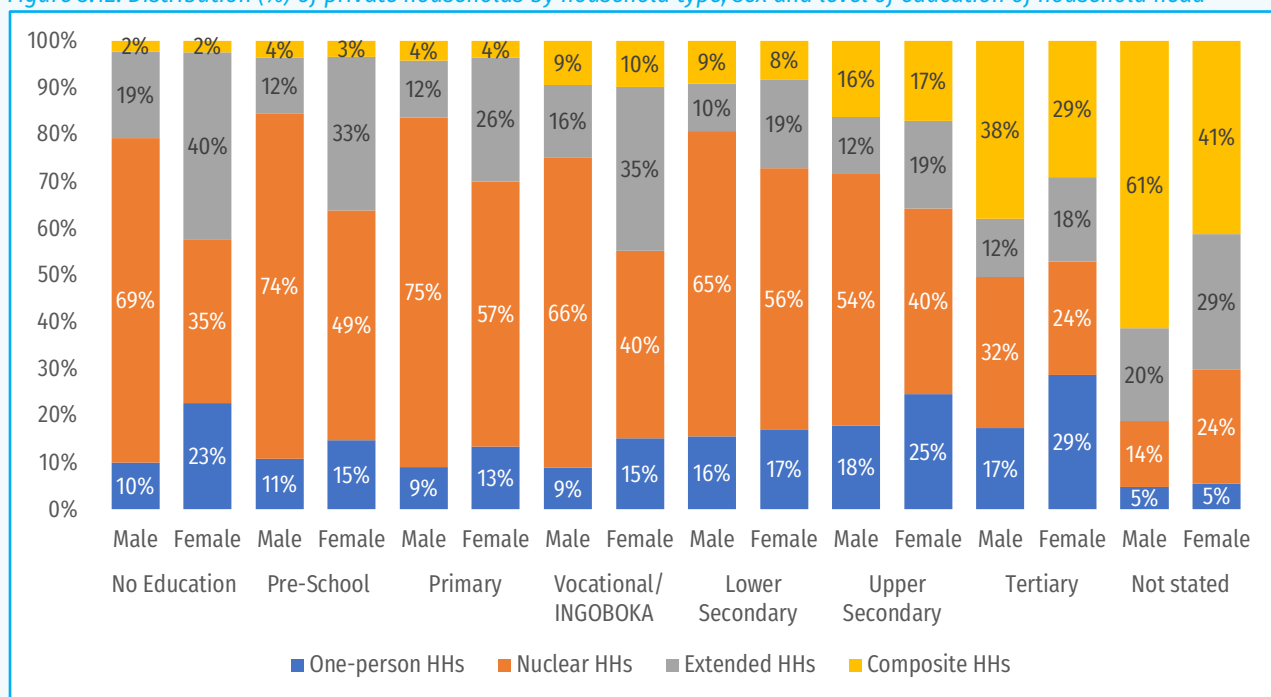

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.11 for more details.

A further disaggregation of the data by sex of the household head indicates that, among households headed by individuals that attended university, composite households are more predominantly both in male and female headed households. This means that, households with heads (either male or female) that attended university, are likely to take non-relatives into their households. On the other hand, extended households are mainly found female-headed compared to male-headed households. For instance, among uneducated household heads extended female-headed

households are almost two times higher than the male-headed households (about 40% and 19% respectively), similarly among household heads with university attendance, the percentage of extended households is higher among female headed households (about 18%) than the one observed among male headed households (about 12%). Finally, the percentage of one-person households among heads that attended university is substantially higher among female heads (about 29%) when compared with their male counterparts (about 17%).

5.3. Structure of private households

This section focuses on the structure of private households by addressing the existence or not of policy-specific target population groups in these households. These groups include, for example, children under one year (target groups for vaccination programmes), between 1-4 years (infant and under-five mortality prevention programmes), children aged between seven and 12 (target groups for primary education), the population aged 15 and above (adult literacy programmes), women aged between 15 and 49 years (target group for reproductive health programmes), etc. This section also reviews the data on the existence of

employed people in private households and further reviews the demographic dependency rate based on these data. Table 5.3 and Table 5.4 present the counts and percentages of private households with members belonging to specific policy-related population groups by area of residence and province respectively. Table 5.3 shows that, at the national level, about 10% of private households have at least one member aged under one while 36% have at least one member aged between one and four. About 42% of private households have at least a member under five years of age while all households have at least a member who is aged 15 or above.

Table 5.3: Number and percentage of private households with members belonging to specific age groups by area of residence

Table 5.4, presenting a similar analysis by province, shows the City of Kigali as standing out from other provinces with the lowest numbers of households with members belonging to almost in all selected age-specific groups, except for the population aged between 15 and 64 and the women aged 15 and 49, for which the proportion observed in the City of Kigali is the highest compared to other age groups observed elsewhere.

Outside the City of Kigali, the highest proportions were observed in the Western (population aged between 1 and 4 years; population aged between 7 and 12 years; and population aged between 0 and 14 years), Southern (population aged 65 years and above) and Eastern provinces (women aged between 15 and 49 years; and population aged between 15 and 64 years).

Table 5.4: Number and percentage of private households with members belonging to specific age groups by province

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 5.5 presents the distribution of private households by the number of members aged 16 and above who are currently employed by area of residence and sex of the household head. It shows that the average household in Rwanda has two members who are currently employed (i.e. about 47% of all households). The disaggregation of the data by area of residence and sex of the household head reveals two important aspects. First, the trend observed at the national level is mainly driven by rural areas as the percentage of households with two economically active members in urban areas is substantially lower (about 42%). Second, the percentage

of household with two members who are currently employed among male-headed households (about 53%) is more predominant than the one observed among female-headed households (about 30%). These findings are further explained by two other findings discussed earlier in this report. First, nuclear households are the most common household type in the country (about 62%). Second, male-headed households, which constitute about 71% of private households in the country, have heads that are relatively young (about 42 years on average). (see Tables 4.1 and Table 4.4; Figure 5.6).

5.4. Age Dependency ratio

Table 5.6 shows the age dependency ratio calculated at the level of private households. Age dependency ratio, in the context of Rwanda, is defined as the sum of members aged between 0 and 15 and aged 65 and above, divided by the total number of members aged between 16 and 64 and multiplied by 100. The demographic dependency ratio values can be below, equal to or above 100. A value of 100 indicates that the sum of members aged 0–15 and 65 and above equals the number of members aged 16–64. A value below or above 100 indicates that the sum of members aged 0–15 and 65 and above is, respectively, greater than or less than the number of members aged 16–64.

Table 5.6 shows that, at the national level, the demographic dependency ratio is about 80. In rural areas the ratio is 86 while it is 66 in urban areas. When the sex of the household head is considered, the ratio displays significant distinctions between male- and female-headed households (77 and 91 respectively). At provincial level, the highest demographic dependency ratios are observed in the Western Province (about 88) and Eastern Province (about 85), with the lowest being in the City of Kigali (about 57).

Table 5.6: Age dependency ratio of private households by province, area of residence and sex of the household head

CHAPTER 6: TYPES OF HABITAT, OCCUPATION ARRANGEMENTS AND HOUSING TENURE

Access to adequate shelter and basic services in households is an important indicator of the population's living conditions. How promptly these services can be provided is, to a certain extent, related to the way human settlements are structured and how they have evolved over time. To ensure the population's easier access to basic services, the government has been promoting a shift in the habitat structure in Rwanda from traditional rural scattered settlements to other more clustered units, as well as attempting to ensure the provision of adequate housing to vulnerable families. In urban areas, the government has been committed to modernising all urban areas by controlling urban development and limiting the development of squatter settlements. At the same time, the government acknowledges the right to shelter for every citizen. The Census provides a valuable opportunity to assess the effect of public policies in improving housing standards in the country.

This chapter presents the distribution of private households by existing types of habitat in the country, sex of the household head, area of residence and province. It also reviews the type of building private households live in as well as their living arrangements and the type of tenure of households in Rwanda.

6.1. Type of habitat

In Rwanda, there are six main types of habitat:

- i) **Clustered rural settlements** or grouped rural settlements, also referred to as *Umudugudu* in the national language;
- ii) **Integrated model villages** (Grouped and planned rural settlement equipped with development infrastructure like roads, adequate drinking water, electricity, etc and social economic services such as schools, selling points, health posts, etc);
- iii) **Old settlement** (Grouped settlement occupied by people with the same job, working for the same project, ...);
- iv) **Dispersed/isolated housing** also referred to as scattered settlements;
- v) **Modern planned urban housing**; and
- vi) **Spontaneous settlement/squatter housing or informal settlements** (squatter habitat usually refers to housing build on someone else's land or housing occupied by a person who is not the owner, such type of housing is negligible in Rwanda).

Table 6.1 presents the distribution of private households by type of habitat, sex of the household head and area of residence. It shows that, out of a total of 3.31 million households in Rwanda, about 2.17

million (or about 65%) are found in umudugudu and about 494,607 (about 15%) are classified as part of dispersed/isolated housing. A third group, representing about 9% of the private households, is classified as spontaneous/squatter housing. The percentage of private households classified as part of umudugudu settlements represents an improvement as compared to the 59% reported by the EICV5 survey (NISR, 2016/17).

Table 6.1 also shows that, the percentage of households in rural areas classified as part of umudugudu is higher (about 75%) than the one observed in urban areas (about 42%). This is the result of the implementation of the national settlement policy, which was passed in 2000. This policy ruled that the official rural settlement is the planned and grouped settlement and, therefore, all local authorities were instructed to implement the villagisation policy.

Since its adoption, most of the private households that were once settled in scattered settlements have been re-grouped, while a large number of new households were built on village sites identified by the relevant local authority for umudugudu development. On the other hand, the percentage of households in urban areas classified as spontaneous/squatter housing is about 12 times higher the percentage observed in rural areas (about 25% and 2% respectively).

The GoR has been also promoting the human settlement in the country by developing and facilitating decent settlement of Rwandans including relocation of those living in scattered settlements and high-risk zones to Integrated Development Program (IDP) model villages. The idea was emerged in 2010 with each of 30 districts

supposed to have a model village to promote the human settlement by providing proper and adequate housing to the most disadvantaged groups and to people living in high-risk rural areas, however, the percentage of households classified as part of integrated model village is still low countrywide (only about 1%).

Table 6.1: Distribution (count and %) of private households by type of habitat by sex of the household head and area of residence

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

As already observed in previous censuses and recent studies including RPHC4 and EICV5, the type of habitat pattern in Rwanda varies considerably across provinces. Table 6.2 presents the distribution of private households by type of habitat and province. It shows that the highest percentage of households in clustered settlements (about 87%) and the lowest percentage of households in dispersed/isolated housing (about 7%) are found in the Eastern Province. A similar observation had emerged from the findings of RPHC4 and EICV5. The second highest

percentage of households in clustered settlements (about 72%) is found in the Southern Province, but the percentage of households that are still living in dispersed/isolated housing remains quite high in this province (about 20%).

When the Provinces outside the City of Kigali are compared, the Northern and West Provinces have the lowest percentage of households clustered settlements (about 71% in each Province) whereas, the highest percentage of households in dispersed/isolated housing

is found in the Northern Province (about 22%). The similar trend observed at the national level for private households classified as part of integrated model village is also evident across all Provinces (only about 1% of the households found in that type of habitat).

The City of Kigali, being the largest urban centre in the country, registered the highest percentage of modern planned urban housing (about 42%) and spontaneous/squatter housing (about 40%) and the lowest percentage of households in clustered settlements (about 4%).

Figure 6.1 presents the spatial distribution of private households found in clustered settlements by sector. The shades of the colour vary, with lighter shades indicating lower percentages and darker shades indicating higher percentages. The map shows that the higher proportions of private households in clustered rural settlements are

found the Eastern province, the centre and West of the country while the lower percentage is found in the City of Kigali and its immediate surrounding in Rulindo and Gicumbi districts, and the West (Ngororero and Karongi districts) and Ruhango in Southern Province

Figure 6.1: Distribution of private households in clustered settlements by sector

Source: 5th Rwanda Population and Housing Census.

Figure 6.2 which presents the evolution in the distribution of private households by type of habitat since 2002, shows that the percentage of private households in

scattered settlement is decreasing while the percentage of those in clustered settlements ('umudugudu') is increasing. As discussed before, this evolution is related

to the implementation of the national settlement policy for providing proper and adequate housing to vulnerable households and households living in high risk zones in the sites identified for umudugudu development. The

percentage of households in spontaneous/squatter settlements, which reached about 9% in 2022 is a reflection of rapid ongoing urbanisation.

Figure 6.2: Evolution between 2002 and 2022 (%) in the distribution of private households by type of habitat

Source: Rwanda Population and Housing Censuses 2002, 2012 and 2022, EICV 2005/06 and EICV 2016/17. Note: Due to comparability reason, “integrated model village” is included in “Clustered rural settlement” for 5RPHC.

6.2. Type of building/living arrangement

The RPHC5 classifies all private households into four main types of building:

- i) House occupied by one household;
- ii) House occupied by several households;
- iii) Storey building occupied by one or more households; and
- iv) Several buildings in a compound occupied by one or more households.

Table 6.3, presenting the distribution of private households by type of building, sex of the household head and area of residence, shows that across all Rwanda

89% of the 3.31 million private households are each occupied by just one household while about 10% are occupied by several households. The households in the category ‘Several buildings in a compound occupied by one or several households’ are rare in the country, representing just about 1%. Table 6.3 also shows that about 72% of the households in urban areas are classified as houses occupied by one household while this percentage is about 96% in rural areas. The percentage of private households classified as houses occupied by several households increases substantially in urban areas (about 24%) when compared to the percentage observed in rural areas (about 4%).

Table 6.4 presents the distribution of private households by type of building and province. It confirms that 'houses occupied by one household' is the most common type of building across the country, mainly explained by urban/rural differences. For this reason, the lowest percentage of 'houses occupied by one household' type (61%) was observed in the City of Kigali, the main urban centre, while elsewhere it ranges from 92% (in the Eastern Province) to about 97% (in the Northern Province). Conversely, the highest percentage of households

classified as 'house occupied by several households' is found in the City of Kigali (34%), a percentage around five times higher than the second highest (about 7%), which is observed in the Eastern province. Most of the households classified as 'Several buildings in a compound occupied by one or several households' in the country are found in the City of Kigali (about 4% of Kigali's households) and in the Southern and Eastern Provinces (about 1% in each Province).

6.3. Housing tenure

In Rwanda, there are six types of legal tenures under which a household can occupy a household. These are:

- i) Owner occupation;
- ii) Tenant occupation;
- iii) Hire purchase;
- iv) Free lodging;
- v) Staff housing; and
- vi) Refuge/temporary camp settlement.

Table 6.5 shows that in Rwanda about 72% of the 3.31 million private households are owned by the households occupying them, while about 22% are occupied by tenants and 4% are free lodging. The analysis by area of residence reveals that, in urban areas, households occupied by tenants (about 50%) are slightly more common than owner-occupied households (about 45%). On the other hand, in rural areas the percentage of owner-occupied households (about 83%) is fairly above the national average while the percentage of tenant-occupied households (about 11%) is about half the national average. The high prevalence of owner-occupied households in rural areas is related to Rwandan culture,

according to which every household head must own his household in order to be highly regarded by the community.

Besides, households in rural areas are built with building materials that are indeed available locally and are therefore generally affordable. On the contrary, construction in urban areas is regulated. Rudimentary building materials are banned and construction works are expensive. The wealthy therefore invest in housing development to generate a rental income. Moreover, urban areas are the preferred destination of in-migrants who then live in rented housing until they can afford to build or purchase their own dwelling (see the RPHC5 thematic report on migration for more analysis in this vein).

When the sex of the household head is considered, it is clear that owner-occupied households are marginally dominant among male-headed households (about 72% among male-headed) compared to 71% among female-headed households. Consistently, the tenant-occupied households slightly dominate among male-headed households (23% among male-headed) compared to 21% among female-headed households.

Table 6.6, which shows the distribution of private households by tenure and province, shows that the picture at provincial level follows the pattern observed for area of residence, with the lowest percentage of owner-occupied households (about 34%) found in the City of Kigali, at about half the second lowest (about 72%)

that is observed in the Eastern province. The highest percentage of owner-occupied households (about 87%) is observed in the Northern Province. Tenant-occupied households are predominantly found in the City of Kigali at about 61%, the level that is at least three times higher than the percentages observed elsewhere in the country.

Figure 6.3 presents the evolution in the distribution of households by housing tenure since 1978. It shows that, at the national level, the percentage of owner-occupied households has been decreasing since 1978. It reduced from about 96% in that year to about 72% in 2022. On the

contrary, the percentage of tenant-occupied households has been increasing from about 2% in 1978 to 22% in 2022. This is again related to the urbanisation process taking place in the country.

Figure 6.3: Evolution between 1978 and 2022 in the distribution of households by housing tenure

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002, 2012 and 2022.

The 5th RPHC also provides information on dwelling ownership among private households that were not found living in their housing unity during enumeration just to know whether they own a residential house in the village they were enumerated or elsewhere in Rwanda. Table 6.7 presents the distribution of private households by dwellings ownership for those not living in their houses, sex of the household head and area of residence. It shows that, almost one out of ten of the private households not living in their housing unity (936

thousand households) found to have a residential house (about 12%). The rate of residential house ownership among private households not living in their housing unity in rural areas is slightly higher than in urban areas (about 13% and 12% respectively). When the sex of the household head is considered, the data shows that, residential house ownership among private households not living in their housing unity is more prevalent among male-headed households (about 14%) compared to about 10% among female-headed households.

Table 6.8 presents the distribution of the private households by residential house ownership among private households not living in their housing unity, across the provinces. The highest rate of residential house ownership among private households not living in their housing unity was observed in the Eastern Province

(about 14%), the second highest rate of residential house ownership among private households not living in their housing unity is found in the City of Kigali (about 12%) and the lowest rate is found in the Southern Province (about 11%).

CHAPTER 7: PHYSICAL CHARACTERISTICS OF THE MAIN BUILDINGS USED BY HOUSEHOLDS

The physical characteristics of the housing unit occupied by the private households may reflect their living conditions. This chapter investigates the current status of the physical characteristics of private households, focusing on the materials used to build the walls, roof and floor of the main building. It starts by presenting the distribution of private households by building materials according to area of residence and provinces and then reviews variations in these characteristics by the highest level of education attended by the household head. Wherever possible, a perspective on the evolution in the distribution of households by these characteristics over time is also offered. The chapter also looks at residential promiscuity. One of the objectives of population and housing censuses is to assess the quality of the housing (UNDESA, 2008, p13). As this chapter addresses the characteristics and quality of housing units, the final section introduces the Housing Quality Index (HQI), which is a measure of the quality of the buildings occupied by the private households in Rwanda.

7.1. Main material of the walls

Table 7.1 presents the distribution of private households by main building material of the walls, area of residence and sex of the household head. It shows that, across all Rwanda, about 93% of the 3.31 million private households live in housing with walls made of sun-dried bricks with or without cement (about 36% and 31% respectively), or wood/mud with or without cement (about 8% and 18% respectively). Durable building materials, such as cement blocks, concrete, burnt bricks with or without cement, stone with or without cement and timber, are used in the walls construction only by 6% of the households in Rwanda. While sun-dried bricks remain the most prevalent construction material for walls, when the data are disaggregated by area of residence, the percentage is higher in urban areas about 74% (including 57% with cement and 17% without cement) than in rural areas about 65% (including 28% with cement and 37% without cement). Households with walls built of wood/mud remain the second largest group in both areas of residence, the percentage observed in rural about 31% (including 8% with cement and 23% without cement) is around two times higher than the one observed in urban

about 13% (including 7% with cement and 6% without cement).

The sun-dried bricks and wood/mud are the most used because they abound across the whole country and are affordable – sun-dried bricks, for instance, can be produced by anyone and construction using such materials does not require any specific skills. On the other hand, the use of durable building materials is expensive and thus less affordable to the majority of the Rwandan population.

Table 7.1 also reveals that, the percentage of households with wood/mud without cement as walls construction material is relatively higher among female-headed households (about 22%) compared to male-headed households (about 15% among male-headed households). Regarding households with sun-dried brick without cement as walls construction material, the use of that material is a little higher among male-headed households (about 33% among male-headed as compared to 30% among female-headed households).

Table 7.2 presents the distribution of private households by the main building material of the walls across the provinces. It shows that the percentage of private households with walls built of sun-dried bricks with cement varies across provinces. As expected, the highest percentage of households with walls built of that material is observed in the City of Kigali (about 60%). Percentages outside the City of Kigali ranging from about 27% in each of the following provinces (Western and Northern) to about 36% in the Eastern Province. On the other hand, the highest percentage of households with

walls built of sun-dried bricks without cement are observed in the Western Province (about 47%) and the Northern Province (about 44%), with the lowest being in the City of Kigali (about 9%). Durable building materials, such as cement blocks, concrete, burnt bricks with or without cement and stone with or without cement, are mainly found in the City of Kigali (about 12%), outside the City of Kigali the percentage of housing built with such materials ranges from about 3% in the Eastern Province to about 5% in the Western and Northern province

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 7.3, presenting the distribution of private households by main building material of the walls and the highest level of education attended by the household head, shows that the household head's level of education is an important factor in explaining the distribution of households by the main material used in the walls of the housing units. It shows that, the percentage of households headed by uneducated individuals living in housing units with walls made of cement blocks or burnt brick with cement is low (about 4% and 6% respectively)

while there is a high percentage of uneducated heads who live in housing with walls made of non-durable materials or wood/mud without cement (about 41% and 34%, respectively). Similarly the percentage of household heads with post primary, secondary or university education that live in a housing built of cement blocks or burnt bricks with cement is higher (about 76% and 65% respectively).

Figure 7.1 below presents the evolution in the distribution of households by the main building material of the walls since 1978. It shows that, the percentage of private households with walls built of wood/mud has been enormously reduced (from about 92% in 1978 to 26% in 2022). In the same period, the percentage of households built of sun-dried brick walls registered an increase of 17

times from about 4% of all houses in 1978 to about 68% in 2022. This large expansion in the use of sun-dried bricks in the last three decades is related to, among other factors, the abundance of the raw material (soil) almost throughout the country (with the exception of the lava zone near the volcanoes), the relatively low production cost and the implementation of the villagisation policy.

Figure 7.1: Evolution between 1978 and 2022 in the distribution of households by the main building material of the walls

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002, 2012 and 2022, EICV 2005/06 and EICV 2016/17.

7.2. Main material of the roof

Table 7.4 presents the distribution of the private households by the main material of the roof and area of residence and the sex of the household head. It shows that, across all Rwanda, almost 100% of the 3.31 million private households live in housing units with roof covered with either iron sheets or local tiles (about 74% and 26% respectively). This represents a significant

change when compared to the EICV5 results, which estimated these percentages at about 68% and 32% respectively (NISR, EICV-2016/17). Iron sheets are mostly used in urban households (about 94%) than in rural areas (about 66%), while local tiles are more prevalent in rural areas (about 34% compared to 6%).

Table 7.5 presents the distribution of households by the main material of the roof and by province. It shows that the highest percentages of households living in housing units covered with iron sheet roofs are found in the City of Kigali and Eastern Province (about 99% in each province) while the lowest (about 39%) is in the Southern Province. On the other hand, the highest percentage of households living in housing units covered with local tiles (about 61%) is found in the Southern Province and the

lowest in the City of Kigali and Eastern Province (about 1% in each province). The widespread use of local tiles in the Southern Province is related to the availability of clay in the valleys of this province. The high percentage of households living in housing units covered with iron sheets in other provinces other than Southern Province is related to the implementation of the villagisation policy which privileges iron sheets since there are limited number of clay valleys in these provinces.

Table 7.6, presenting the distribution of households by the highest level of education attended by the household head and the main material of the roof, indicates that higher proportions of households headed by individuals either with no education or primary education lives mostly in housing units with non-durable roofing materials or grass (about 95% and 97%, respectively) than

in household with concrete or industrial tile roof (about 18% and 50% respectively). On the contrary, the higher proportions of households headed by individuals that attended post-primary, secondary or university education are found living in housing units covered with industrial tile or concrete roof (about 50% and 82% respectively).

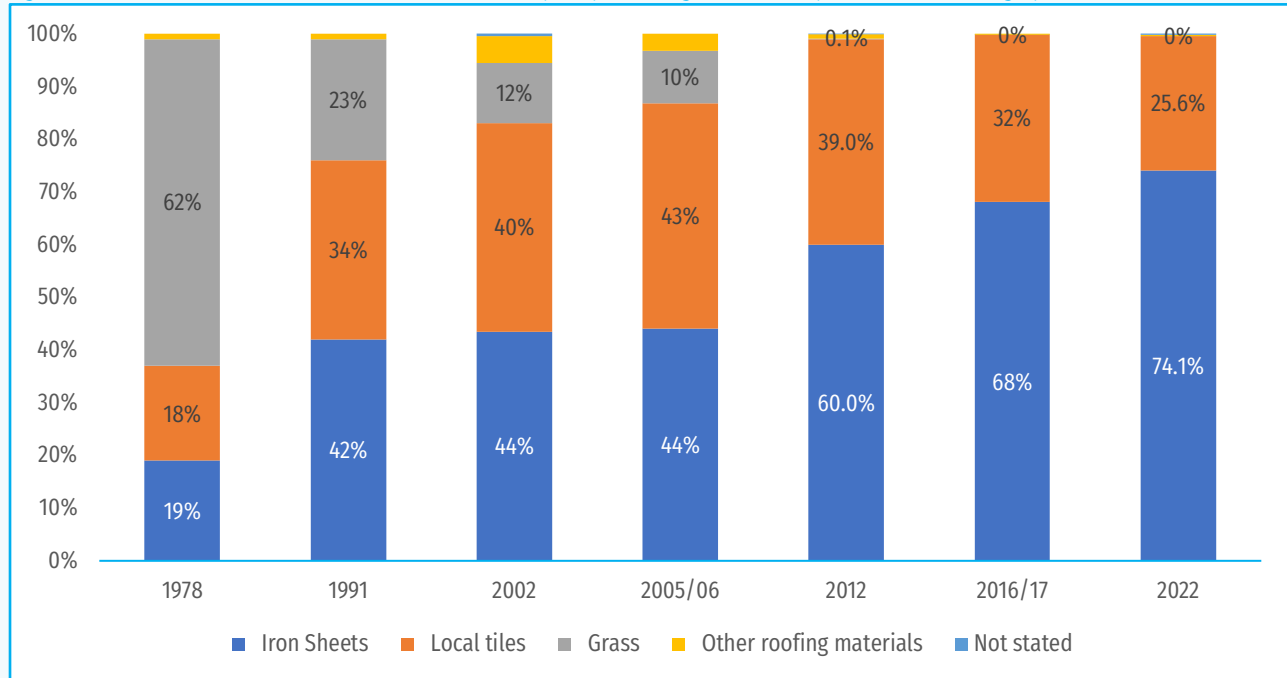

Figure 7.2 presents the evolution in the distribution of private households by main material of the roof since 1978. It shows that there has been a tremendous change in the use of building materials for roofing since the first

Census. While in 1978, thatch/grass was the most used building material for roofing (about 62%), in 2022 the percentage of households living in housing units covered with thatch/grass has fallen to almost 0.0%. The most

significant falls in the use of thatch/grass roofs took place between 1978 and 1991 (almost three times decrease from 62% to 23%) and between 2005 and 2022 (ten times decrease from 10% to almost 0.0%). On the other hand, iron sheets and local tiles became the most predominant building materials used. In 2012, the percentages of households living in housing units covered with iron sheet and local tile were close (about

60% and 39% respectively). From that point on, however, iron sheets became the single most used material for roofing in Rwanda (about 74%). Iron sheet has been the preferred building material for roof by the GoR and NGOs in the implementation of the villagisation policy and during eradication of thatched housing campaign since 2010.

Figure 7.2: Evolution between 1978 and 2022 in use of roof building materials of the main building of the household

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002, 2012 and 2022, EICV 2005/06 and EICV 2016/17.

7.3. Main material of the floor

Table 7.7 presents the distribution of private households by type of floor, area of residence and sex of the household head. It shows that, across all Rwanda, about 91% of all private households are living in housing units with floors made of either earth (about 60%) or cement (about 31%). Households which live in housing units with floors built of cement are mostly found in urban areas (about 59%) compared to rural areas (about 20%), whereas households living in housing units with floors built of earth are mostly found in rural areas (about 74%) compared to urban areas (about 28%). When the sex of the household head is considered, the percentage of households living in housing units with earth floor is higher among female-headed households (about 65%) than among male-headed households (59%), whereas

households living in housing units with cement floors are more prevalent among male-headed households (about 33%) than among female-headed households (about 28%).

Even though, the use of clays/granite tiles as flooring material is low at national level (about 3%), when areas of residence are considered, the percentage of households living in housing units with clays/granite tile floors is predominant in urban areas (about 11%) compared to rural areas (about less than 1%). The same table indicates that, the percentage of households with clays/granite floors among male-headed households (about 4%) is double the one observed among female-headed households (2%).

Table 7.8, presenting the distribution of private households by type of housing floor and by province, shows that most of the households outside the City of Kigali live in housing units with earth floors. The highest percentages of households living in housing units with earth floors are found in the Northern and Western (about 75% in each province), in the Southern province

(about 64%) and the lowest in the City of Kigali (about 19%). In the City of Kigali, about 79% of the households have houses with floors built of cement (about 63%) or clays/granite floor (about 16%). The large use of earth is related to its free availability all over the country. In contrast, cement and clays/granite floor are expensive and limited number of households can afford it.

Table 7.9 presents the distribution of private households by the highest level of education attended by the household head and the type of floor of the housing units. First, it shows that the percentage of households headed by an uneducated individual increases three times more when one moves from a household living in housing units with floors built of durable materials such as cement or concrete (about 11% for each type) to houses with floor built of less durable materials such as

earth and hardened dung (about 30% and 28% respectively). Second, the percentage of households headed by individuals that attended either post-primary, secondary or university education increases up to nine times when one moves from a household living in housing units with earth/sand floor (about 9%) to a household living in houses with floor built with more durable materials such as clays/granite tiles (about 78%).

Figure 7.3 presents the evolution in the percentage of households living in housing units with floor built of concrete since 1991. It shows that the percentage of households living in such housing units has increased by 25 % from about 10% in 1991 to about 35% in 2022.

Figure 7.3: Evolution between 1991 and 2022 in use of concrete as floor building materials of the main building of the household

Source: Rwanda Population and Housing Censuses 1991, 2002, 2012 and 2022. Note: Due to comparability reason, concrete, clays/granite tiles and cement are combined into "Concrete" for 5RPHC.

7.4. Residential promiscuity

Residential promiscuity relates the size of households to the size of the housing units they occupy by dividing the number of members of the household by the number of bedrooms existing in the housing unity. Figure 7.4 presents the mean number of persons per bedroom by area of residence and sex of the household head. It shows that, at the national level, there are 2.1 persons per bedroom, meaning that on average, one bedroom is shared by only two individuals. The number of persons

per bedroom varies slightly by area of residence, with the rural areas showing a relatively higher number of persons per bedroom than the urban areas. When the sex of the household head is considered, female-headed households have a lower number of persons per bedroom compared the one observed in male-headed households.

Figure 7.4: Mean number of persons per bedroom (residential promiscuity index) of private households by area of residence and sex of household head

Figure 7.5 presents the mean number of persons per bedroom by province. It shows that it ranges from 1.93 in the Northern province to 2.14 in the Eastern provinces.

7.5. The housing quality index (HQI)

The physical and environmental characteristics of the dwellings occupied by private households can actually be summarized in an index which provides a comprehensive measure of the suitability of the living conditions of their members. The index can equally serve as a basis for comparative analysis of housing quality across different population settlements in Rwanda.

A housing quality index was constructed following several recent population and housing censuses including the latest Myanmar Population and Housing Census (2014)⁴. A great number of authors (Behr et Al; World Bank, 2021; Babaola, 2016; Ibem and Alagbe, 2015; Eggers and Moumen, 2013; Jiboye, 2010; etc) have

provided methodological background for building and computing a Housing Quality Index using census data. The table below reveals how the physical components of the floor, the roof and the walls of the housing units- but also different amenities including the source of water, the type of sanitation facilities, and the type of fuel used for cooking - were ranked and used to build the housing quality index (HQI) for the private households in Rwanda. Based on the housing quality index obtained from Table 7.10, five categories have been identified as follow: Rank1 (Highest quality), Rank2 (mid-high quality), Rank3 (middle quality), Rank4 (low quality) and Rank5 (poorest quality).

⁴ The 2014 Myanmar Population and Housing Census: Thematic report on housing conditions and household amenities. Census report Volume 4-I. (published in 2017)

Source: 5th Rwanda Population and Housing Census Questionnaire.

Adopting the ranking order shown in Table 7.10, the results of the 5th Rwanda PHC shown in Table 7.11 indicate that, at the National level, the quality of housing for most households in Rwanda is ranked 5 (about 27% of the 3.31million households), while 20% of households are living in housing unit whose quality level is ranked 1. The data reveals also that one out five households found in housing unit whose quality level is ranked 1. As expected, households in housing with the highest quality (rank 1) are mostly found in urban areas (about 58% compared to 4% found in rural areas), whereas households living in

housing units with the poorest quality (rank 5) are mostly found in rural areas (about 35% compared with 7% found in urban areas). When the sex of the household head is considered, the percentage of households living in housing with the poorest quality (rank 5) is higher among female-headed households (about 32%) than male-headed households (25%), whereas households living in housing with the highest quality (rank 1) are more prevalent among male-headed households (about 22%) than female-headed households (about 16%).

Table 7.12 shows the distribution of households according to the quality of housing by province. The predominance of highest quality housing is particularly evident in the City of Kigali, where about 71% of households are living in dwellings ranked 1, while less than 13% of households are living in such dwellings in other Provinces outside the City

of Kigali. Conversely, Southern and Western Provinces have the highest percentage (about 38% in each Province) of households living in the lowest quality housing (rank 5) and the lowest percentage of households living in the lowest quality housing in the City of Kigali (about 4%).

The quality of housing among private households is evaluated against the highest level of education attended by the household head. Table 7.13 shows that, the possibility of living in dwellings with the highest quality

increases with the level of education attended by the household head. About 83% of the households that are occupied by individuals headed by households headed who attended university education live in the dwellings

ranked 1 compared to about 5% of the households occupied by individuals headed by households head with no education. As a result, the percentage of households living in the lowest quality housing (rank 5) among households headed by uneducated individuals (about 40%) is more than 20 times higher than among households headed by individuals with university as level

of education (about 2%). When the sex and highest level of education of the household head are considered, the percentage of households in housing with the highest quality (rank 1) is higher among households headed by females with university as level of education (about 87%) than among male-headed households with the same education(83%).

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

The housing quality among private households is assessed against type of habitat. Table 7.14 shows that, the housing quality patterns differ considerably across types of habitat. For instance, the highest quality housing is mostly predominant in the modern planned urban housing, where 83% of households are living in dwellings ranked 1 compared to the one observed in dispersed or isolated housing, where only about 3% of households are living in such dwellings. Conversely, the percentage of households in dispersed or isolated housing is higher in the lowest housing quality rank 5 (about 47%) than the one found in modern planned urban housing (about 1%).

Households in integrated model village, although not large, proportionately, are scattered among all the housing quality categories but are more prevalent in ranks 1 and 2, where about 72% of the households live in dwellings in these two first categories. The data reveal also that, higher proportion of households living in housing ranked 4 and 5 (18% and 28% respectively) are recorded in planned rural settlement (*umudugudu*) against only 11% of the households living in the dwelling with the highest housing quality (rank1).

CHAPTER 8: HOUSEHOLDS' ACCESS TO WATER, SANITATION, HYGIENIC FACILITIES AND ENERGY

In order to improve social and economic development and public health conditions, Rwanda has committed to improving access to drinking water, sanitation and hygienic facilities among the population by 2024. This is in relation to the attainment of key strategic interventions 47, 69, 70 and 71 of the NST1. To that end, the GoR defined its policy targets to increase by 2024 the access to drinking water and adequate sanitation facilities to 100% from 87% in 2016/17 and 86% in 2016/17 of the population, respectively (NST1). The GoR has also committed to increase the population with access to electricity by scaling it up to all from 34.4% in 2016/17 to 100% by 2024 in collaboration with the private sector to reach off-grid areas and investments in grid expansion (NST1).

This chapter reviews households' current level of access to the above mentioned services across the country. It is organised into two sections. The first section outlines the level of access to improved drinking water sources, use of toilet facilities and main modes of sewage and waste disposal. The second section addresses the households' level of access to sources of energy for lighting and for cooking, and availability of energy-saving stoves. The GoR has committed to halve the number of households depending on firewood as a source of energy for cooking from about 80% in 2016/17 to 42% by 2024 through various initiatives promoting the use of clean fuels such as cooking gas and biogas (NST1). Wherever possible, the chapter presents a perspective on the progress made by the country on each of these matters by comparing the RPHC5 data with data from previous Censuses and surveys.

8.1. Households' access to water, sanitation and hygiene

Access to safe drinking water is recognized as a human right, and the SDGs have set very ambitious targets for 2030 in the area of access to drinking water. Lack of access to clean and potable water is primarily responsible of diseases such as cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. Diarrhoeal diseases exacerbate malnutrition and remain among the primary causes of child deaths at global level.

While improving water quality is critical to prevent disease, improving accessibility and availability of drinking water is equally important. The SDGs targets aim to achieve universal access to basic water services and universal access to safely managed water sources (target 6), which requires universal access to improved sources of water. This is also consistent with Rwanda Vision 2050 which aims to achieve universal access to water by 2024, 55% access of water on premises by 2035, and 99% by 2050.

The WHO/UNICEF Joint Monitoring Programme (JMP) for water supply and sanitation provides a classification of different types of water supply as improved and unimproved sources of water. As of the latest definitions by the JMP, improved sources of water include the

following types of water supply: tap water, protected ground water, rain water, packaged water, delivered water. Surface water and unprotected ground water are considered unimproved.

Unsafe management of human excreta and poor personal hygiene are closely associated with diarrhoea and parasitic infections, it is believed that the incidence of diarrhoeal disease can be reduced by one third⁵ if universal access to improved sanitation was achieved.

An improved sanitation is defined as one that prevents human contact with excreta. Likewise sources of water, the WHO/UNICEF JMP provides a classification for improved and unimproved types of toilet facility. According to the JMP, improved sanitation facilities include flush or pour flush to piped sewer systems, septic tanks or pit latrines, ventilated improved pit latrines, pit latrines with slabs and composting toilets. Pit latrines are considered improved if they have slabs or if they are ventilated, and unimproved if they have no slab. Basic sanitation service is improved sanitation facility which is private, and limited sanitation service is improved sanitation shared by two or more households. Basic

⁵WHO. Water, sanitation and hygiene for accelerating and sustaining progress on Neglected Tropical diseases. A Global Strategy 2015-2020. Geneva: WHO press, 2015.

sanitation service can be considered safely-managed depending on how excreta are managed. Open defecation is the disposal faeces in fields, forests, bushes, etc.

8.1.1. Main sources of water

Table 8.1 presents the distribution of private households by main source of water, sex of the household head and area of residence. It shows that across all Rwanda, about 82% of the 3.31million households collect drinking water from improved water sources, among which protected springs/wells (28%) and public taps outside the compound (about 33%) are the most common. However, only about 18% of the private households have access to drinking water on their premises, this includes households using mineral water for drinking as they have been considered as households with access to drinking water piped on premises. It is worth noting that countrywide, about 3% of the private households use mineral water as source of drinking water. When areas of residence are considered, the use of mineral water as source of drinking water for households in urban areas is more predominant (about 8%) as opposed to rural areas where, only less than 1% of the households use mineral water for drinking. Households collecting water from

unimproved water sources use mostly unprotected springs/wells (11%), rivers or lakes/ streams/ ponds/ surface water (about 6%).

The same table shows that, the percentage of households using improved water sources is higher in urban areas (about 96%) than in rural areas (about 77%). Furthermore, as shown in Table 8.1 urban and rural areas rely on various improved sources: while about 62% of the households in urban areas use mostly a public tap outside the compound and pipe-borne water inside the compound (about 32% for each case), in rural areas about 67% of the households use mostly protected springs/wells (about 34%) and public taps outside the compound (about 33%). With reference to the sex of the household head, it appears that, there is a little difference in terms of use of improved drinking water (83% for male against 81% for female). Figure 8.1 provides a summary of the results discussed in Table 8.1.

Figure 8.1: Distribution (%) of private households by access to improved sources of drinking water, area of residence and sex of the household head

Source: 5th Rwanda Population and Housing Census.

Figure 8.2 presents the distribution of the private households by main source of drinking water across the provinces. As one would expect, the highest percentage of households using improved drinking water sources (about 97%) was observed in the City of Kigali while the lowest (about 75%) was observed in the Western

Province. Consequently, the highest percentage of households using unimproved drinking water sources (about 25%) was found in the Western Province, a percentage that is about eight times higher than the one observed in the City of Kigali.

Figure 8.2: Distribution (%) of private households by access to improved sources of drinking water and province

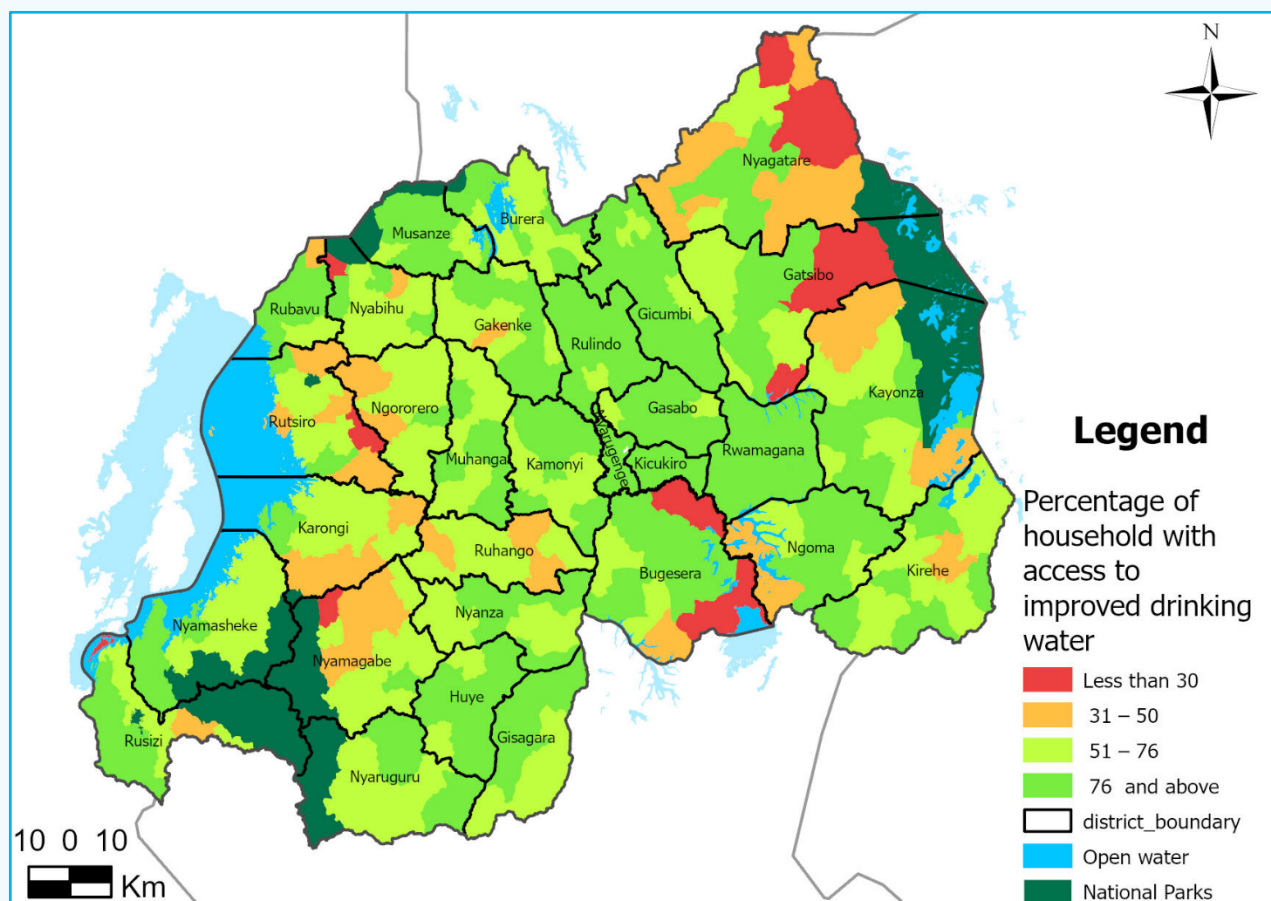

Source: 5th Rwanda Population and Housing Census.

Figure 8.3 presents a spatial distribution of private households with access to improved sources of drinking water by sector. This time, the darker the colour the lower the percentage of households with access to improved drinking water sources. It confirms the results that

appear in Figure 8.2 by showing darker shades in most of the sectors in the Western Province. Darker shades can also be seen in parts of the Southern and Eastern provinces.

Figure 8.3: Percentage of private households with access to improved drinking water sources by sector

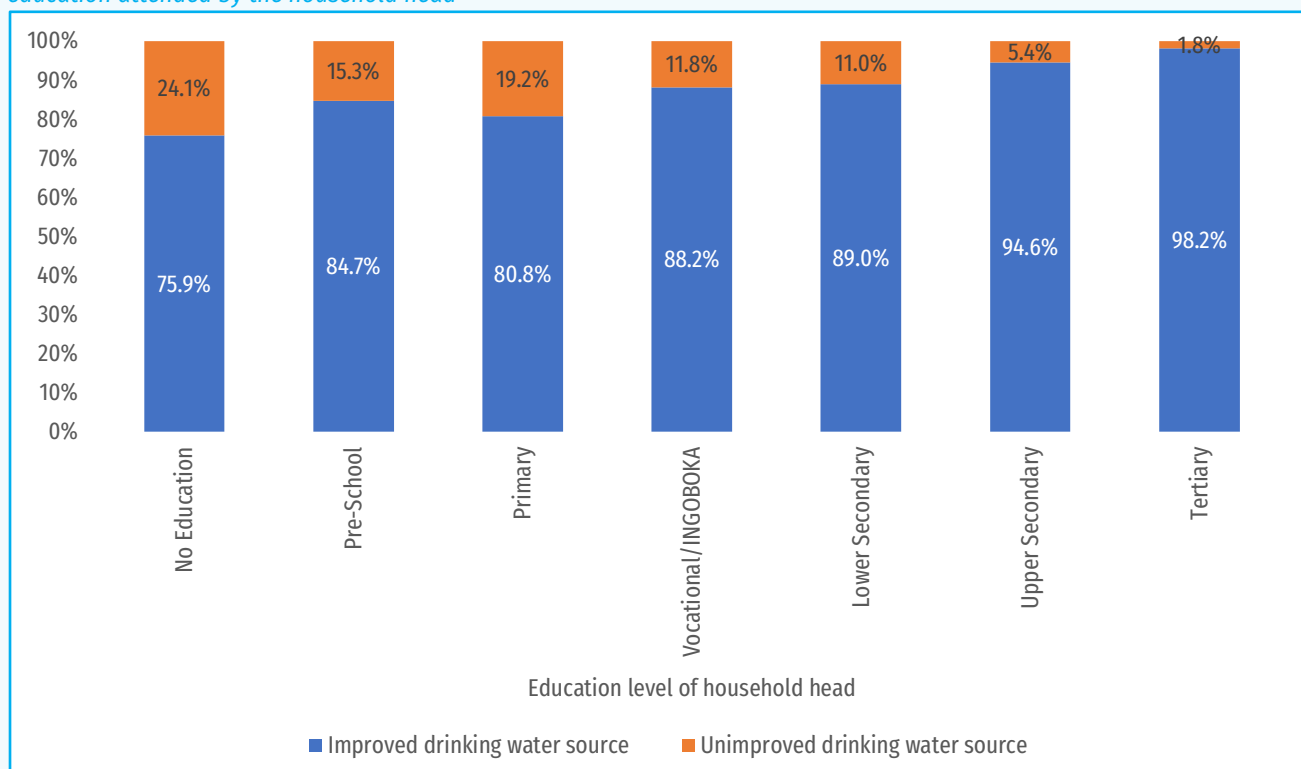

Source: 5th Rwanda Population and Housing Census.

Figure 8.4 presents the distribution of private households by access to improved sources of drinking water and the highest level of education attended by the household head. It shows that access to improved sources of drinking water increases with the level of education attended by the household head. About 76% of those households that are occupied by individuals headed by households head with no education have access to improved sources of water compared to about 98% of the

households occupied by individuals headed by households head with university as level of education. As a result, the percentage of households with access to unimproved drinking water sources among households headed by uneducated individuals (about 24%) is almost 12 times higher than among households headed by individuals with university as level of education (about 2%).

Figure 8.4: Distribution (%) of private households by access to improved sources of drinking water and the highest level of education attended by the household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.22 for more details.

Figure 8.5, presenting the evolution in the distribution of private households by access to improved drinking water sources since 1978, it shows that, the percentage of households with access to improved drinking water sources has been increasing since that year. In 1978, about 51% of private households had access to improved water sources, while in 2022 this percentage had increased to about 82%.

Figure 8.5: Evolution between 1978 and 2022 in the distribution (%) of private households by access to improved sources of water, 1978–2022

Source: Rwanda Population and Housing Censuses 1978, 2002, 2012 and 2022, EICV 2005/06 and EICV 2016/17.

Table 8.1, Figure 8.1, 8.2, 8.3, 8.4 and 8.5 present data on the percentage of households with access to drinking water sources. According to SDGs definition, it can sometimes be useful to calculate indicator for access to drinking water sources at population level rather than households level. However, the differences are of course very minor. The data reveals similar trend at population level, about 82% of the 13.1 million people have access to drinking water sources in Rwanda. The detailed information about access to drinking water sources at population level is displayed in Table C.24.

Beyond access to improved water sources by the populations, which is very important when it comes to the realization of SDG, there are some key indicators of access to water which could not be measured in the 2022 Rwanda PHC. One of the key indicators when it comes to measuring access to water is access to basic service of water supply (SDGs target 6.1). According to the WHO/UNICEF JMP, the indicator measures access by the

households to improved sources, but includes a criterion for the accessibility to the source, which should be accessible on premises (within the dwelling, plot or yard) or collection time should not exceed 30 minutes round trip from the dwelling (including queuing time). Unfortunately, the distance or time necessary for water collection by household members was not collected during the 2022 Rwanda PHC, making it impossible to come up with the SDG indicator of access to basic service of water supply.

Another key indicator is access to safely-managed service of water supply (SDGs target 6.1), which goes further by adding criteria for water being available when needed including during the dry season, and free from contamination. Likewise, information about the time needed for water collection, availability of water when needed and water contamination were not collected during the 2022 Rwanda PHC, and the indicator could not be measured this time.

8.1.2. Types of toilet facilities

Table 8.1 presents the distribution of private households by type of toilet facility, sex of the household head and area of residence. It shows that, at the national level, about 92% of the 3.31 million private households use improved toilet facility, among which pit latrine with constructed floor slab used by one household (69%) and the one used by several households (20%) are the most commonly used toilet facilities. Data reveal that, the use

of flush toilet facility is not common in Rwanda, since it is used only by 3% of private households. Although the use of flush toilet is low at national level, in urban areas a significant number of private households use that type of toilet facility (about 11%), a percentage which is twenty-seven times higher than that observed in rural areas (less than 1%).

Table 8.2: Distribution (count and %) of private households by type of toilet facility by sex of the household head and area of residence

Figure 8.6 presents the distribution of private households by access to improved toilet facility, sex of the household head and area of residence and by taking into account whether a household shares toilet facility with members from other households. It shows that at national level, the percentage of households that use improved toilet facility that is not shared with other households is 72%. When the areas of residence are considered, unshared improved toilet facility is the most common in rural areas (about 78% compared to about 56% in urban areas). The high percentage of private households with unshared

toilet facility in rural areas is related to the availability of space and less crowding. In urban areas (especially in squatter housing), households often use shared toilet facilities due to lack of space or more households live in buildings or compounds occupied by several households. When the sex of household head is considered, the percentage of private households using unshared improved toilet facility is larger among male-headed households than female-headed ones (about 73% and 68% respectively).

Figure 8.6: Distribution (%) of private households by access to unshared improved toilet facility, area of residence and sex of the household head

Source: 5th Rwanda Population and Housing Census.

Table 8.3 presents the distribution of private households by type of toilet facility and province. As expected, it follows the patterns observed by area of residence, with the City of Kigali displaying a pattern similar to the one observed in urban areas and the other provinces' patterns being very similar to the one observed in rural areas. At provincial level, the highest percentage of households using improved toilet facility is observed in the City of

Kigali (about 97%) and Eastern province (about 93%), in the remaining provinces (Western, Northern and Southern), the percentage of households using improved toilet facility falls to about 91% in each province. The use of flash toilet is much higher in the City of Kigali (about 15%) compared to other provinces where, the use of that type of toilet facility is less 3% in each province.

Figure 8.7 presents the distribution of private households by access to improved toilet facility and province of residence. The result in this figure also takes into consideration that a household shares toilet facility with members from other households. It shows that at provincial level, the percentage of households that use unshared improved toilet facility follows the pattern observed for area of residence, with the lowest

percentage (about 48%) found in the City of Kigali, the second lowest (about 74%) is observed in the western province. The highest percentage of households that use unshared improved toilet facility (about 79%) is observed in the Northern Province. The low percentage of private households with unshared toilet facility in the City of Kigali is related to the lack of space or over-crowding of the households.

Figure 8.7: Distribution (%) of private households by access to unshared improved toilet facility of water and province

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.19 for more details.

Table 8.4 presents the distribution of private households by the highest level of education attended by the household head and the type of toilet facility used in the household. It shows that, although flush toilets are not common in Rwanda (about 3% of all private households), about 83% of the households using this type of toilet facility (unshared flush toilet) are occupied by individuals headed by households headed who attended post-primary, secondary or university-level education.

Households headed by individuals either with no education or who have not gone beyond primary school are mostly found occupying households using pit latrine without constructed floor slab, either used by one households (about 93%) or by several households (about 89%). These households occupy most of the households that use the bush (about 95%). Therefore, these results show a strong relationship between the education level of the household head and the type of toilet facility used by the members of households they occupy.

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 8.3 and Table 8.4 present data on the percentage of households by type of toilet facility. According to SDG definitions, it can sometimes be useful to calculate indicator for toilet facility at population level rather than household level. However, the differences are not high. The data reveals comparable trend at population level, about 93% and 77% of the 13.1 Million people use improved and unshared improved toilet facilities respectively. The detailed information about the use of toilet facility at population level is presented in Table C.25.

Beyond the type of toilet facility used by household the populations, the SDG indicator for access to basic

sanitation service includes a criterion for household not sharing the toilet facility with other households (WHO/UNICEF JMP). Figure 8.6 and Figure 8.7 present the distribution of private households by access to basic sanitation service, which is access to improved sanitation facility which is not shared with other households. SDG target 6.2 aims to achieve universal access to safely-managed sanitation services. According to the WHO/UNICEF JMP, safely-managed sanitation incorporates further criteria including the method for emptying the toilet facility and method of excreta disposal and treatment. Unfortunately, this information where not collected during the 2022 5th Rwanda Population and Housing Census.

8.1.3. Modes of sewage disposal

Table 8.5 presents the distribution of households by main mode of sewage disposal, also disaggregating by sex of the household head and area of residence. It shows that across Rwanda, the courtyard is the commonly used mode of sewage disposal (about 45%). About 46% of the households use bush (about 20%), cesspool (about 18%) or sump (about 8%), while a third group accounts for about 10% of the private households that use the following sewage disposal mode: about 6% main sewer,

1% Rivelet/Trench/channels, 1% in street, and 2% other mode of sewage disposal. It is important to note that, the use of courtyard as mode of sewage disposal reduces considerably among households in urban areas. The percentage of households in rural areas using the courtyard for sewage disposal (about 53%) is more than double of the one observed among urban households (about 24%). As expected, the use of modern modes of sewage disposal (sumps, cesspools and main sewer

system) is more common in urban areas (about 59%) than in rural areas (about 20%).

Table 8.6 presents the distribution of private households by the main mode of sewage disposal used by the occupying private households, disaggregating the data by province. It shows that, the use of courtyard for sewage disposal is found across all provinces with varying prevalence. The highest percentages of households using this mode of sewage disposal are found in the Southern and Northern provinces (about 59% and 51% respectively) and the lowest in the City of Kigali (about 17%). When

modern modes of sewage disposal such as sumps, cesspools and main sewer system are combined together, the City of Kigali clearly stands out from other provinces. About 67% of the households in this province use sumps (about 7%), cesspools (about 52%) or the main sewer (about 8%). The second highest percentage for these three modes (about 29%) was found in the Western Province (sump – 9%; cesspool – 15% and mains sewer – 5%).

8.1.4. Modes of waste disposal

Table 8.7, presenting the distribution of households by main mode of household waste disposal, provides an overall outline of the use of waste-management facilities by households. Across all Rwanda, about 84% of the households either use household compost dumping (about 51%) or household's fields/bushes (about 33%) as their main mode of waste disposal. Another group, comprising about 15% of the households, uses public compost dumping (about 5%) or the waste collection companies (about 10%). When the areas of residence are considered, the data reveals that the use of waste

collection companies as main mode of household waste disposal increases among households in urban areas, becoming the most commonly used mode of waste disposal. It accounts for about 33% of the households in urban areas (compared to less than 1% in rural areas). Nevertheless, household compost dumping still remains very common among households in urban areas (about 32%), while household compost dumping (about 59%) and household's fields/bushes (about 35%) remain the predominant modes of household waste disposal in rural areas.

Table 8.7: Distribution (count and %) of private households by main mode of household waste disposal by sex of the household head and area of residence

Table 8.8 presents the distribution of private households by their main mode of waste disposal according to province. It shows that, while household compost dumping is the most predominant mode of waste disposal used outside Kigali (ranging from about 49% in the Western Province to about 67% in the Eastern

Province), in the City of Kigali, waste collection companies (about 53%) are the main mode used for waste disposal, although household's fields/bushes and compost dumping are also fairly widely used there (about 25% and 17% respectively). Household's fields/bushes are the second most substantial mode of waste disposal used

outside the City of Kigali, with the percentage of households using such a mode varying from 24% in the Eastern to 39% in the Western Province.

Table 8.8: Distribution (count and %) of the private households by main mode of household waste disposal by province and area of residence

Figure 8.8 presents the evolution in the percentage of private households using compost dumping as the main mode of waste disposal since 2002. It shows that, this percentage increased faster during the period between

2002 and 2005 (from 46% in 2002 to 56% in 2005) but slightly slowed down in the recent period between 2012 and 2022 at around 57–56%.

Figure 8.8: Evolution between 2002 and 2022 in the percentage of private households using compost dumping as main mode of household waste disposal

8.2. Sources of energy for lighting and cooking

There is global consensus and growing body of evidence that, access by households to clean energy for cooking, lighting and heating is essential to achieving a range of global priorities including to improve health, environmental protection and equitable economic growth. Goal 7 of the SDGs is aimed at improving access to, affordable, reliable, sustainable, and modern energy for all by 2030. This includes access to electricity and reliance on clean fuel for cooking (target 7.1).

New normative guidance from WHO on indoor air quality highlights the importance of addressing both fuel and

technology in order to tackle related issues of public health more efficiently. Clean fuels and technologies for cooking are those which mainly rely on Liquefied Petroleum Gas (LPG), biogas, and electricity (electric stove, solar cooker). Reliance on solid fuels for cooking is responsible for high levels of indoor air pollution, and is considered harmful to human health as well as environment. Solid fuels often used for cooking include biomass and fossil fuels like wood/charcoal, coal/lignite, animal waste, crop residue, grass, but also plastic waste.

8.2.1. National grid connectivity

Table 8.9 presents the distribution of private households by connectivity to the national grid, sex of the household head and area of residence. It shows that, across all Rwanda more than half of the 3.31 million households are connected to national grid (about 53%). As expected, the percentage of households that are connected to the national grid is higher in urban areas (about 83%) than in

rural areas (about 40%). When the sex of household head is considered, the data reveals also that, the percentage of households connected to the national grid is more prevalent among male-headed households (about 55%) compared to about 46% among female-headed households.

Table 8.9: Distribution (count and %) of the private households by connection to the national grid or other private mini grid by Sex of the household head and area of residence

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 8.10 presents the distribution of the private households by connectivity to the national grid, across provinces. As one would expect, the highest percentage of households connected to the national grid (about 89%) was observed in the City of Kigali while the lowest (about 44%) was observed in the Southern Province where consequently, about 56% of the households are not

connected to the national grid, a percentage that is about five times higher than the one observed in the City of Kigali. The second highest percentage of households connected to the national grid (almost half of the households) is observed in the Western Province. Figure 8.9 provides a summary of the results discussed in Table 8.9 and Table 8.10.

8.2.2. Sources of energy for lighting

Table 8.11 presents the distribution of private households by main source of energy for home lighting, sex of the household head and area of residence. It shows that, across all Rwanda, about 61% of the 3.31 million private households predominantly use electricity as their source of home lighting (This comprises about 47% from REG or other private sources, about 14% from solar energy and less than 1% from Generators). This estimate shows a substantial change when compared to the last census results, which estimated an electrification rate of the

private households at about 18%. The second most used source of home lighting is flashlight/phone flashlight (about 28%), this may be related to a substantial increase of mobile phone ownership occurred since 2012.

As expected when the area of residence is considered, the percentage of households using electricity as source of energy for home lighting is higher in urban areas (about 85%) than in rural areas (about 51%). Table 8.11 reveals that, the use of electricity for lighting is higher among

male-headed households (at about 64%) than female-headed households (about 54%). About 8% of the households either use candles (about 3%), firewood

(about 4%) or lantern (about 1%) as source of energy for home lighting.

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 8.12 presents the distribution of the private households by main source of energy for lighting and by province. As expected, it follows the patterns observed by

area of residence, with the City of Kigali displaying a pattern similar to the one observed in urban areas and the other provinces' patterns being very similar to the

one observed in rural areas. The City of Kigali clearly stands out from other provinces. About 90% of the households in this province use electricity for lighting, this comprises electricity from REG or other private sources (about 88%), solar energy (about 2%) or generators (about less than 1%), in comparison with other provinces, the percentage of private households using electricity ranging from about 54% in the Northern Province to about 58% in the Eastern Province.

Data presented in Table 8.12 also shows that, the flashlight/phone flashlight are the second most used source of energy for lighting outside the City of Kigali, with percentage ranging from about 27% in the Western Province to about 38% in the Southern Province, with less percentage in the City of Kigali (about 6%).

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 8.10 presents a map showing the percentage of households using electricity as the main source of energy for home lighting across the sectors of Rwanda. The green colour indicates the households with high percentage of access to electricity. Table 8.10 shows that, the use of electricity for lighting in Rwanda varies from a district to another. The map indicates that more than a half of the private households using electricity for lighting are recorded mostly in the City of Kigali, southern part of the Eastern Province, and along the coast of lake Kivu.

Figure 8.10: Percentage of private households with electricity as main source of energy for lighting by sectors

Source: 5th Rwanda Population and Housing Census.

Figure 8.11 presents the distribution of the private households by type of electricity used by households for lighting across province, area of residence and sex of the household head. It gives a summary of the results discussed in Table 8.11 and Table 8.12 as well as some idea about the use of electricity among private households connected to the national grid when compared with Figure 8.10

Although the data show that, more than half of the households in Rwanda are connected to the national grid (see Figure 8.9), results presented in Figure 8.11 shows that, only 47% of the households use electricity from the national grid countrywide. It thus follows that some households that are connected to the national grid do not

use electricity for lighting (about 5%). When the area of residences are considered, the data clearly reveals that, the rate of not using electricity for the grid connected households is about 7% in rural areas, a percentage which is almost four times higher than the one observed in urban areas (about 2%).

At provincial level, the rate of not using electricity for the grid connected households follows the same pattern observed for area of residence, with the lowest percentage (about 1%) found in Kigali City, the second lowest (about 3%) is observed in the western province. The highest percentage of grid connected households that do not use electricity for lighting (about 9%) is observed in the Southern Province.

Figure 8.11: Percentage of private households by type of electricity used by households according to the sex of the household head, province and area of residence

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table 8.11 and Table 8.12 for more details.

Figure 8.12 presents the evolution in the percentage of households using electricity as the main source of energy for home lighting since 1978. It shows that access to electricity for lighting among private households is improving remarkably, increasing from about 1% at the time of the first Census in 1978 to about 18% in 2012 and about 61% in 2022.

Figure 8.12: Evolution between 1978 and 2022 in the percentage of households using electricity as main source of energy for lighting

8.2.3. Sources of energy for cooking

The 5th Rwanda PHC provides the detailed information on primary and secondary sources of fuel used for cooking in Rwanda. Table 8.13 and Table 8.14 give information about the use of primary sources, while information on the use of secondary sources of energy for cooking as an alternative to the main one is given in Table C.30 and Table C.31. Table 8.13 presents the distribution of private households by main sources of energy for cooking, sex of household head and area of residence. It shows that, across Rwanda, about 93% of the households rely on solid fuels for cooking, which includes firewood (about 76%) and charcoal (about 17%) as primary sources of energy for cooking. A third group, accounting for about 5%, uses gas as main source of energy for cooking. Although gas is used at a lower rate countrywide, when

compared with areas of residence, gas is commonly used in urban areas (about 13%) compared to rural areas (about 1%).

Firewood is almost three times more likely to be used in rural areas (93%) than in urban areas (about 34%), while charcoal is 13 times more likely to be used in urban areas (about 50%) than in rural areas (about 4%). Table 8.13 also shows that, the use of gas for cooking is slightly higher among male-headed households than female-headed households (about 5% and 4% respectively). Indeed often, some households would never cook for themselves. Data reveals that, countrywide, about 1% of the total households found to use none of sources of energy for cooking as they never cook.

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Table 8.14 presents the distribution of private households by main source of energy for cooking by province. It shows that firewood is the most predominant source of energy for cooking outside the City of Kigali, with the percentages of households relying on this energy ranging from about 84% in the Western and Eastern Province (in each province) to about 89% in the Southern Province. Charcoal is the most predominant source of energy for cooking in the City of Kigali, being used by about 58% of

the households. Regarding the use of gas, the City of Kigali clearly stands out from other provinces. This indicates that, one out of five households in the City of Kigali uses gas as source of energy for cooking (about 20%), in comparison with other provinces, the percentage of private households using gas ranges from about 1% in the Southern, Western and Northern Provinces (in each province) to about 3% in the Eastern Province.

Source: 5th Rwanda Population and Housing Census, 2022 (NISR).

Figure 8.13 presents the evolution in the percentage of private households using solid fuel as the main source of energy for cooking since 1991. It shows that the level has not changed much and that it remains the overwhelmingly dominant source of energy for cooking in

Rwanda. Modern sources of energy are not used in cooking for various following reasons: high cost of the sources itself, high cost of cooking equipment and high cost of solar energy units, etc.

Figure 8.13: Evolution between 1991 and 2022 in the percentage of private households using solid fuel as main source of energy for cooking

Source: Rwanda Population and Housing Censuses 1991, 2002, 2012 and 2022.

8.2.4. Availability of energy-saving stoves in households

In order to reduce the level of firewood consumption, the GoR has been promoting the installation and use of energy-saving stoves⁶ in private households. Figure 8.14 shows that, at the national level, about 32% of the private households using solid cooking fuels, have these energy-saving stoves installed. Energy-saving stoves are more popular in rural areas (about 39%) than in urban areas (about 16%). At the provincial level, the highest percentage of households with an energy-saving stove is found in the Southern Province (about 51%) and the lowest in the City of Kigali (about 7%), although in Kigali most households do already use charcoal instead of firewood.

Figure 8.14: Number and percentage of private households possessing an energy-saving stove by sex of the household head, province and area of residence

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.26 for more details

⁶ Information about the availability of energy-saving stove was asked only for households reported to use solid cooking fuels (Firewood, Charcoal, crop waste, etc) either as their main or as alternative source of energy for cooking.

CHAPTER 9: HOUSEHOLDS' OWNERSHIP OF SPECIFIC ASSETS

The RPHC5 captured data on specific assets, including on ICT devices (such as radios, televisions, mobile phones or computers) and means of transport (such as bicycles, motorcycles or vehicles, etc.). The analysis of ownership of specific assets is interesting in that as it provides an indication of the population's living conditions, given that the use of these assets is increasingly significant in contemporary societies and plays an active part in the welfare of households. This chapter reviews the data on ownership of these assets.

9.1. Ownership of ICT devices

Figure 9.1 presents the percentage of private households with radios and those with mobile telephones by area of residence, sex of the household head and province. Across all Rwanda, about 82% of the private households have a radio set. This percentage is higher in urban areas (about 92%) than in rural areas (about 77%), but is

substantially higher among households headed by male (about 86%) than among those headed by female ones (about 71%). Across provinces the highest percentage of households with a radio is found in the City of Kigali (about 94%) and the lowest in the Southern Province (about 76%).

Figure 9.1: Percentage of private households with radios and mobile telephones by area of residence, sex of the household head and province

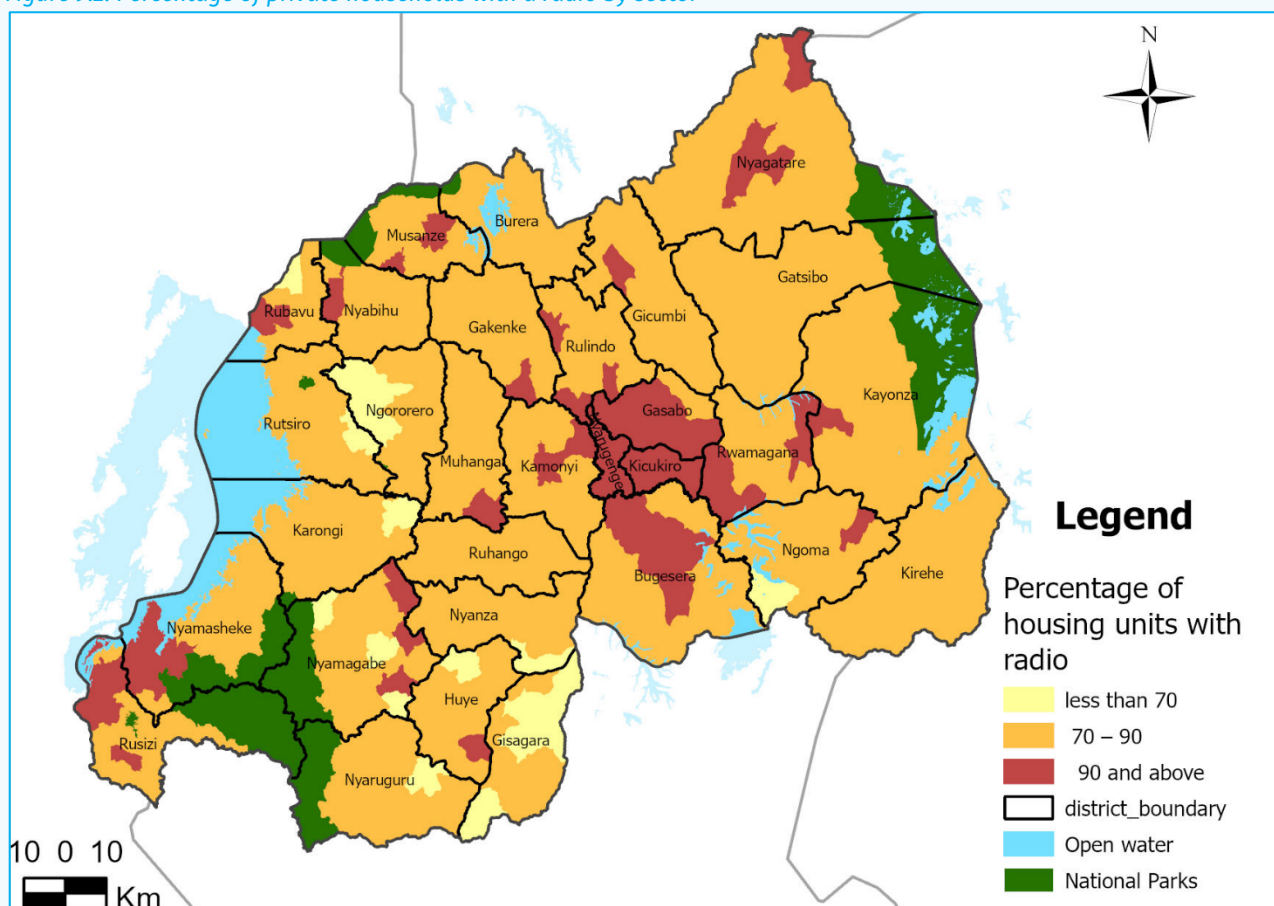

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.27 through Table C.29 for more details

Figure 9.1 also shows that about 78% of households have mobile telephones. This percentage is much higher in urban areas (about 90% of all urban households) compared to rural areas (about 73%) and also higher among households occupied by male-headed households (about 82%) as opposed to households occupied by female-headed households (about 67%). When provinces are considered, the highest percentage (about 92% of all Kigali households) is observed in Kigali and the lowest (about 72%) in the Southern Province, thus realising a substantial difference between these two

provinces (20%). Figure 9.2 shows the percentage of private households that own a radio set by sector. The darker the colour on the map, the higher the percentage of households with a radio is. The highest percentage of households that own the radio set are found in the City of Kigali and the surrounding regions toward the Northern and Eastern provinces and other urban areas (90% and above). There are very small areas where the percentage of households owning radio set falls below 70%.

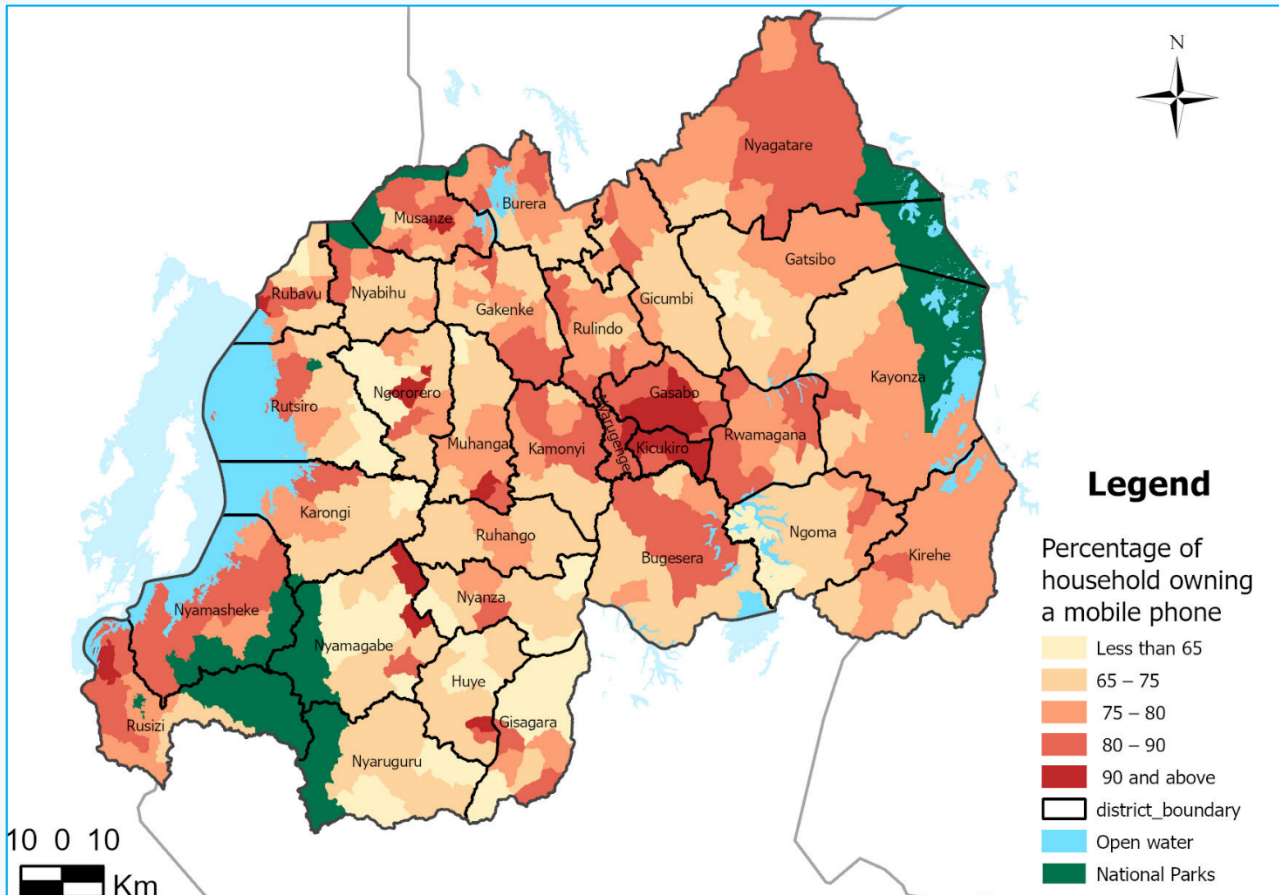

Figure 9.2: Percentage of private households with a radio by sector

Source: 5th Rwanda Population and Housing Census.

Figure 9.3 presenting a map with the percentage of private households with mobile phones by sector, offers a similar reading. Darker shades represent sectors with higher proportions of households with mobile phones. Once again, the City of Kigali and the surrounding areas and the Eastern and Northern provinces clearly stand out.

Figure 9.3: Percentage of private households with a mobile phone by sector

Source: 5th Rwanda Population and Housing Census.

Figure 9.4 presents the percentage of households with televisions and computers by area of residence, sex of the household head and province. At national level, the percentage of households with televisions is 12% and those with a computer is 4%. The gap between urban and rural is substantial in both cases, reaching a 6-fold difference in the case of televisions (5% and 30% respectively) and 12-fold difference in the case of computers (1% and 12% respectively). Among female- and male-headed households, television and computer ownership is about double (7% and 14% for case of

television) and (2% and 5% for the of computer) respectively. When provinces are considered, the gap between the City of Kigali and the rest of other provinces is similar. There are around 5 times more chance of a private household having a television (about 36% in the City of Kigali as opposed to 4% in the Northern, Southern and Western Provinces). When it comes to computer ownership, there are around 8 times more chance of a private household to possess a computer (about 16%) in the City of Kigali as opposed to other provinces (2% in each province).

Figure 9.4: Percentage of private households with, respectively, a television and a computer by area of residence, sex of the household head and province

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.27 through Table C.29 for more details.

9.2. Households' access to the internet

Since 2000, Rwanda has been resolutely committed to the development and use of ICT in several domains of both the public and private sectors so as to speed up economic development and transform the country into a competitive and information-rich knowledge-based economy (MINECOFIN, 2018). For this reason, the ICT sector is regarded as a key element in regard to national development. Indicators of the level of penetration of ICT in Rwandan society usually refer to ownership of

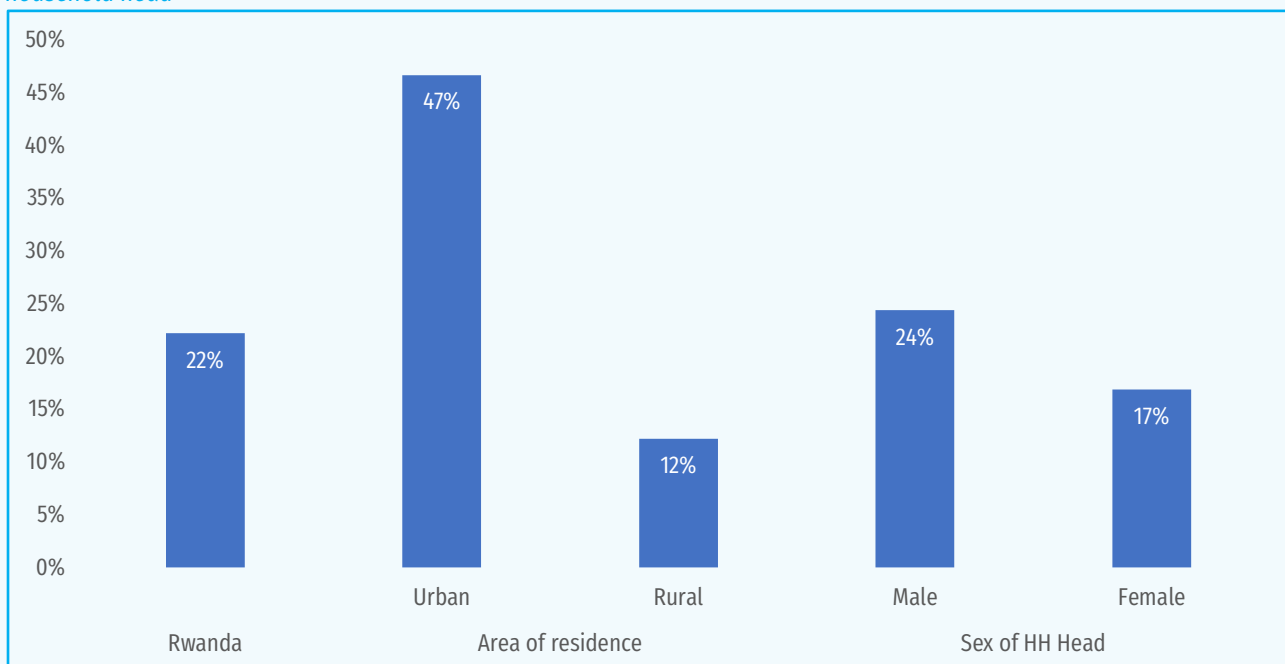

computers and access to the internet. This section focuses on the latter and is organised into two sub-sections. The first sub-section reviews the level of access to the internet and the second presents the places mostly used by the population to access the internet are considered. In each case the data is analysed against cross-cutting characteristics such as area of residence and sex of the household head.

9.2.1. Prevalence of households with access to the internet

Figure 9.5 presents the percentage of private households whose members have access to the internet by area of residence and sex of the household head. It shows that, at the national level, about 22% of private households have members with access to the internet. As expected, the percentage of private households with access to the

Internet is higher in urban areas (about 47%) than in rural areas (about 12%). This represents about a 4-fold gap between urban and rural areas. Members from male-headed households are relatively better served than their fellows from female-headed households in regard to access to the internet (about 24% compared to 17%).

Figure 9.5: Percentage of private households with members who have access to the internet by area of residence and sex of household head

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.15 for more details.

Figure 9.6 presents the percentage of private households with members who have access to the internet by province. It shows that at provincial level, access to the internet varies from one province to another. As expected, the highest percentage of households with members with access to the internet is observed in the

City of Kigali, where more than a half of the households have such access (53%). The percentage of households with members having access to the internet outside the City of Kigali ranges between 16% (in Southern province) and 18% (in Eastern province). The gap between the City of Kigali and other provinces is around three-fold.

Figure 9.6: Percentage of private households whose members have access to the internet by province

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.15 for more details.

9.2.2. Places used to access the internet

Figure 9.7 presents the percentage of private households with household heads who have access to the internet from specific places by area of residence. It shows that in urban areas, home, office and school/education place are the most commonly used sites for accessing the

internet by household heads (63%, 34% and 2% respectively). The same trend is observed in rural areas as well, where home, office and school/education place are the most predominant sites for accessing the internet (66, 29% and 3% respectively).

Figure 9.7: Percentage of private households with heads having access to the internet from specific places by area of residence

Source: 5th Rwanda Population and Housing Census, 2022 (NISR). Notes: (1) See Table C.16 for more details

Figure 9.8 presents the percentage of private households with household heads who have access to the internet from specific places by sex. It shows that male household

heads are more likely to be found accessing the internet from home and office, the same pattern is observed for female household heads.

Figure 9.8: Percentage of private households with heads having access to the internet from specific places by sex of the household head

Source: 5th Rwanda Population and Housing Census, 2022 (NISR). Notes: (1) See Table C.17 for more details.

9.3. Ownership of means of transport

Figure 9.9 presents the percentage of private households with bicycles by area of residence, sex of the household head and province. It shows that, across all Rwanda, about 11% of private households have bicycles. When area of residence is considered, the data reveal that bicycles are more prevalent as means of transport in rural areas (about 12% of the total rural households) than in urban areas (about 9%). In regard to the sex of the

household head, households headed by male are three times more likely to have a bicycle than a female-headed household (about 14% as opposed to about 4%). At provincial level, the Eastern Province clearly stands out as having the highest percentage (about 24%) of its private households with bicycles, the lowest percentage of households with bicycles is found in the Western Province (around 2%).

Figure 9.9: Percentage of private households with a bicycle by area of residence, sex of the household head and province

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.27 through Table C.29 for more details

Figure 9.10 presents the percentage of private households with vehicles and motorcycles by area of residence, sex of the household head and province. It shows that the data reveal many similarities among households' ownership of these assets. First, at the national level the percentage of households with vehicles (about 2%) is similar to the one with motorcycles (again about 2%). Second, across areas of residence, both are predominantly found in urban areas, although vehicles

are three times higher to be found in these areas (about 5%) than motorcycles (about 2%). Third, the percentage of households with vehicles among male-headed households is similar to the one with motorcycles (2% for each asset). Finally, in the City of Kigali, the percentage of households with vehicles (about 8%) is more than double of the percentage of households with vehicles observed in all other provinces (3%).

Figure 9.10: Percentage of private households with vehicles and motorcycles, respectively, by area of residence, sex of the household head and province of residence, sex of the household head and province

Source: 5th Rwanda Population and Housing Census. Notes: (1) See Table C.27 through Table C.29 for more details

Table 9.1 shows that the percentage of households with communication devices has sharply increased from 1978 to 2022, especially in regard to mobile phones and televisions. The percentage of households with a radio has registered a 3-fold increase from about 27% in 1978 to about 82% in 2022, while that of households with mobile phones increased 39-fold between 2002 and 2022

(from about 2% to 78%). These gains are related to factors such as the rise in imports of ICT devices, coupled with the suppression of some taxes on ICT devices by the Government. Although the GoR also suppressed taxes on computers, they remain a prohibitively expensive item for the majority of private households and are not considered a basic tool in everyday life.

Table 9.1: Evolution between 1978 and 2022 in the proportion of private households with specific assets

Year	Household assets						
	Radio	Television	Cell phone	Computer	Vehicles	Motorcycles	Bicycles
1978	27.1	-	-	-	-	-	-
1991	29.0	-	-	-	-	-	-
2002	41.9	0.1	1.8	0.1	0.7	0.3	8.6
2012	64.0	7.8	54.1	2.4	1.3	1.2	14.1
2022	81.5%	12.3%	78.1%	4.2%	1.8%	1.6%	11.0%

Source: Rwanda Population and Housing Censuses 1978, 1991, 2002 and 2022.

CONCLUSION

The analysis of data from the 5th Rwanda Population and Housing Census has revealed the following key findings in regard to the characteristics of the households and housing.

The total number of households has been increasing over time. In 2022, it reached about 3.31 million private households countrywide. About 71% of the private households are located in rural areas.

At the national level, about 71% of the private households are headed by males and 29% by females. The percentage of private households headed by males or females has remained constant since the last census. Female household heads tend to be, on average, older than male household heads; the mean age of female household heads is 51 while for male household heads it is 42. From age 45 and above, the percentage of female-headed households is higher than that of male-headed households. About 73% of household heads are currently married, 12% widowed, 12% have never been married and 4% are separated or divorced. About 23% of household heads have no education, 56% have attended primary school and about 14% and 6% have attended lower or upper secondary school and university respectively.

About 62% of the private households in Rwanda are classified as nuclear households. Extended and composite households make up about 18% and 7% respectively, while one-person households represent about 13% of all private households. The mean size of private households is 4.1 persons and has remained stable since 1978.

The RPHC5 indicates that the implementation of the villagisation policy has been progressing well. In 2012, about 49% of private households lived in clustered rural settlements (umudugudu), while in 2022 this percentage had increased to about 65%. The Census also shows that households living in spontaneous/squatter housing are predominantly observed in urban areas (about 25%) comparatively to rural areas (about 2%). The most common type of building arrangement in Rwanda is a *house occupied by one private household*, which is used by about 89% of the total private households, while storey buildings are uncommon even in urban areas (less

than 1%). Although owner occupation still dominates housing tenure, accounting for about 72% of all private households, it has been falling consistently since 1978 while tenant occupation has been on the rise. The rise of tenant occupation is particularly perceptible in the rural areas.

Sun-dried bricks with or without cement, or wood/mud with or without cement, are the most commonly used building materials for walls, accounting for about 93% of private households in the country. Iron sheets and local tiles are the most commonly used materials for roofing, accounting for about 99% of the households. The use of iron sheets by Rwandan households appears to constantly increase over time, against the use of local tiles. At national level, the use of iron sheets went from 60% to 74% between 2012 and 2022, while the use of local tiles went from about 39% to 26% over the same period of time. Thatched houses have been eradicated across the country. Earth remains the most widely used material for floors, especially in rural areas. At the national level, it accounts for 60% of all private households, Cement is used by 31% of the private households as main material for floor construction. Across all private households, there are two persons on average for one bedroom in a house.

About 82% of the private households have access to drinking water from improved water sources. The percentage of households with access to improved drinking water sources is substantially higher in urban areas (about 96%) than in rural areas (about 77%), while across the provinces the lowest percentage is observed in the Western Province (about 75%) and the highest in Kigali City (about 97%).

About 92% of Rwanda's households have improved toilet facilities, of which about 72% are unshared improved toilet facilities. The use of flush toilets is very limited countrywide, whereby it accounts for only about 3%, even though, in urban areas, about 11% of the private households use that type of toilet facility. About 45% of all households use the courtyard as the main mode for sewage disposal while household compost dumping is the main mode of waste disposal, being used by 51% of all households.

One of the primary objectives of the rural electrification strategy was to “encourage households to access the most appropriate form of electricity based on their income levels and usage patterns, and ensure that as households’ energy needs increase in line with economic growth they are able to access technologies aligned with these increased needs” (MININFRA, 2016). Findings from the RPHC5 show that, there has been outstanding progress in line with this objective. In fact, across all Rwanda, about 61% of the private households use electricity as their main source of energy for home lighting, which comprises about 47% from REG or other private sources, 14% from solar energy and less than 1% from generators.

Indeed, access to electricity has significantly improved in Rwanda since 2012, whereby only 18% of the private households used electricity for home lighting. Efforts by the GoR aimed at improving access to electricity by Rwandan private households have produced tangible results, and this is even more visible in the rural areas. In fact, the use of electricity for home lighting in rural areas increased from 7% in 2012 to 51% in 2022.

Further findings concern connectivity to the national electricity grid. While more than half of the private households across Rwanda are connected to the national grid (about 53%), only 47% use electricity for their home lighting. It thus appears that about 5% of the households which are connected to the national grid do not use electricity for lighting or do not use at all, and this observation is even more preponderant in the rural areas. Actually, out of the 40% private households connected to electricity from the grid in rural areas, only 33% use electricity for home lighting. The fact that households would not use electricity for home lighting

despite being connected to the national grid may raise obvious concerns about the functionality or the affordability of the gridline for a minority of the private Rwandan private households, especially in the rural areas of the country. But this observation will need to be investigated further in order to better understand the reasons for some grid-connected households not actually using electricity.

Energy for cooking comes almost exclusively from the use of biomass/solid fuels in rural areas even in urban areas. To alleviate the intense consumption of biomass or solid fuel as source of energy for cooking, the Government of Rwanda (GoR) should put much effort into promoting the use of clean fuel, improved cooking technologies and use of energy-saving stoves in households as across the country, about 93% of the households rely on solid fuels for cooking, which includes firewood (about 76%) and charcoal (about 17%) as primary sources of energy for cooking.

The majority of households in Rwanda own ICT devices such as radios and mobile phones (about 82% and 78% respectively). Ownership of Television and computers is still limited to a few households, three out of twenty-five of the private households in Rwanda own a television and one out of twenty-five owns at least one computer.

About 22% of private households have members with access to the internet.

Bicycles can be found in about 11% of the households, while motorcycles and vehicles can be found in just 3%. As expected, the percentage of households with vehicles and motorcycles is higher in Kigali City than elsewhere in Rwanda (about 8% and 2% respectively).

ANNEX A: CENSUS QUESTIONNAIRE

This annex provides the key pages of the Census questionnaires. The full questionnaires including all cover sheets can be obtained from the NISR.

As mentioned above, two different types of questionnaires were administered, one for private households and one for institutional households. The questionnaire for private households contained a person record, a household record and a mortality record. The questionnaire for institutional households contained only a person record.

1. Yes
2. NO → H28A

H23A: Where were agricultural activities done?

1. In household owned land
2. In rented land (in cash or in kind payment or for free)
3. In both households owned land and in rented land

H24: " What types of crops did your household grow in last 12 months?"

01. Maize		12. Yams& Taro	
02. Rice		13. Cooking Banana	
03. Sorghum		14. Dessert Banana	
04. Wheat		15. Banana for Beer	
05. Bean		16. Vegetables	
06. Pea		17. Tea	
07. Groundnut		18. Coffee	
08. Soybean		19. Sugarcane	
09. Cassava		20. Pyrethrum	
10. Sweet potato		21. Flowers	
11. Irish potato		22. Others, specify...	

H25: What type of vegetables that household grew in last 12 months? Ask this question if on question H24 vegetables is in selected crops"

ASK THIS QUESTION IF H24=16

01. Amaranths		13. Garlic	
02. Tomato		14. Lettuce	
03. Cabbage		15. Broccoli	
04. Onion		16. Spinach	
05. Carrot		17. Celery	
06. Eggplant		18. Leeks	
07. Black eggplant		19. Pumpkin	
08. Sweet pepper		20. Cucumber	
09. Pepper		21. Mushroom	
10. Cauliflower		22. Chayote	
11. French beans		23. Cassava Leaves	
12. beetroot		24. Other vegetables	

H26: "How many tea trees does your households has?

Ask this question if on question H24 tea tree is in selected crops

H27: How many coffee trees does your households has?

Ask this question if on question H24 Coffee tree is in selected crops

H28A: Does your household has any fruit tree?

1. Yes
2. No => Go to Section M

H28B: What Type and How many (fruit trees) does your household grow?

	28BA: Type	28BB: How many trees do you have?
1. Avocado		
2. Orange		
3. Papaya		
4. Guava		
5. Lemon		
6. Mango		
7. Mandarin		
8. Jack fruits		
9. Beefheart		
10. Passion fruits		
11. Pineapple		
12. Tree tomato		
13. Watermelon		
14. Strawberry		
15. Other fruit		

SECTION M: MORTALITY									
M1: Is there any member of the household who died 12 months prior to the census night (16/08/2021-15/08/2022)? 1.Yes 2.No => End of the interview									
If there was a death in the HH during the 12 months prior to the census night ,Write their Names and ask the following questions									
S/N	M2: Names	M3: SEX	M4: AGE at Death	M4A:Age at death for infants	M5: Place of death	M6: Manner of Death	If the Deceased Person was a female aged 10-49 years, we ask the following questions:		
	Write the names of those who died during the last 12 months	1.Male 2.Female	How old was [NAME] when (he/she) died? IF THE AGE IS 1 YEAR OR ABOVE => M5 (Record 000 if less than 1 year)	How many months or days [NAME] had before dying? RECORD THE ANSWER IN MONTHS IF THE AGE WAS FROM 1 TO 11 MONTHS. RECORD THE ANSWER IN DAYS IF THE AGE WAS FROM 0 TO 29 DAYS	where the death for the [NAME] took place? 1. At community 2. At health facilities	"What is the manner of death of [NAME]?" 1.Natural cause/disease 2.Accident 3.Suicide 4. Homicide 9. Don't know IF THE ANSWER IS 2-9 =>Next Person End if no other died person	M7: "Did [NAME] death occur while Pregnant?" 1.Yes => Next Person 2.No	M8: "Did the death Occur during the childbirth?" 1.Yes =>Next Person 2.No	M9: "Did the death occur during the 6 weeks' period following the termination of pregnancy?" 1: Yes =>Next Person 2: No=>Next Person =>Next Person End if no other died person
1	<input type="checkbox"/>	<input type="text"/>	<input type="text"/> 1:days <input type="text"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2	<input type="checkbox"/>	<input type="text"/>	<input type="text"/> 1:days <input type="text"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3	<input type="checkbox"/>	<input type="text"/>	<input type="text"/> 1:days <input type="text"/> 2:months	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

ANNEX B: GLOSSARY OF KEY TERMS AND DEFINITIONS

This Glossary provides definitions of key concepts and indicators used in the thematic reports of the Fifth Rwanda Population and Housing Census (RPHC5). Readers are referred to the methodological sections of

the respective reports for a more detailed technical explanations of indicators.

B.1. Population and demographic characteristics

Resident status: People with resident status are persons who have been living in a place for more than six months where they were enumerated or who have the intention to stay there for more than six months. These individuals represent the population usually living in such places.

Present residents: individuals present in their place of usual residence on the reference night, or

Absent residents: individuals not present in their place of usual residence on the reference night. The person must be absent for a period shorter than or equal to six months.

Visitors: Persons who were not usual residents of the household. They might be absent residents in another place in Rwanda, or non-residents of the country, for example, tourists present at the time of the Census from other countries.

De facto population: A concept that defines enumerated persons on the basis of their actual location at the time of the census (present residents + visitors): Includes all persons physically present in the country or given area at the reference date.

De jure population: A concept that defines enumerated persons on the basis of their usual place of residence at the time of the census. (Present residents + absent residents):

The de jure population includes all usual residents of a given country or area, whether they were physically present in the area at the reference date or not. It also refers to the resident population. Most of the analyses presented in the thematic reports are based on the de jure population.

B.2. Disability

Disability prevalence: This is defined as the percentage of all the people age 5 years and above reported having at least one disability divided by the entire population of persons age 5 years and above.

Disability status: differentiates the population into those with and those without a disability. Persons with disabilities include those who have long-term physical, mental, intellectual, or sensory impairments which in interaction with various barriers or environments may hinder their full and effective participation in society on an equal basis with others.

The following limitations in activity functioning are considered in the RPHC5: seeing, hearing, mobility, cognitive, communication and self-care using Washington Group on Disability Statistics Short Set of questions. In addition, questions of albinism and short stature were added to the questionnaire.

Seeing difficulty

Seeing difficulty describes the various degrees of vision loss. A person is considered to have eyesight or vision disability if he/she has difficulty seeing even if he/she wears eyeglasses or contact lenses.

Hearing difficulty

Hearing difficulty refers to complete deafness or partial hearing in one or both ears, hard of hearing. Those with hearing difficulty can also use a hearing aid.

Mobility difficulty

Physical or mobility difficulty refers to difficulties in moving, i.e. walking, climbing stairs, using hand, sitting upright, or standing. This disability restricts one's physical movement, say body movement or paralysis of legs, hands, or the whole body. Persons with this type of disability can use assistive equipment and supportive devices that assist them to move around. For example,

those who use wheelchairs, crutches among other mobility aids.

Cognitive difficulty

Cognitive difficulty affects people's ability to perform activities like other people of similar age groups. They may have difficulty remembering things or concentrating on what he/she is performing. It includes many different functions such as the ability to pay attention, learn and retain information, solve problems, and use language to express thoughts. This disability hampers clear thoughts in the mind. It also exhibits problems in comprehending any new ideas or opinions or finding solutions and therefore restrains a person from learning or even coordinating functions/activities.

Self-care difficulty

This refers to difficulties in dressing, bathing, eating, grooming and hygiene, toileting or getting around the home or inside the home. The difficulties may have arisen as a result of other disabilities or impairments. These types of difficulties may be present in most disabilities. It may be more pronounced in mental disabilities and severe physical disabilities.

Communication difficulty

Speech and language disorders refer to problems in communication or difficulties in producing oral speech sounds or problems with voice quality. They might be

characterized by an interruption in the flow or rhythm of speech, such as stammering. These delays and disorders range from simple sound substitutions to the inability to understand or use language. Some causes of speech and language disorders include hearing loss, brain injury, learning disability, substance abuse, physical impairments such as cleft lip, deformed lip or palate, and vocal abuse or misuse. Persons with speech disabilities are often not able to communicate well with others.

Short stature

Short stature is a general term used to describe a condition in which a person's height is well below the average height of his or her peers. Short stature typically means that a person's height is below that of the shortest 3 percent to 5 percent of people of the same age and sex.

Albinism

Albinism is a rare, non-contagious, genetically inherited condition occurring in both genders regardless of ethnicity, in all countries of the world. The condition results in a lack of pigmentation in the skin, hair and eyes, causing vulnerability to sun exposure and bright light. Almost all persons with albinism are visually impaired, with the majority being classified as "legally blind. Skin cancer is common amongst a majority of PWA living in the region of Sub-Saharan Africa.

B.3. Marital status and nuptiality

Information on marital status was collected on the resident population aged 12 and above. The question was formulated as '*what is [name] marital status?*' and, responses were recorded as provided. Seven categories constituted the question on marital status:

Married to one wife/husband officially: an individual who was in legally accepted marital union with one partner at the moment of the Census.

Married to one wife/husband unofficially: an individual who was in marital union with one partner, but that was not legally officiated at the moment of the Census.

Live in a polygamous union: An individual is said to be in polygamous union when he is married with more than one spouse. People living in polygamous union in the context of this census were men having more than one wife or wife living in a marital union with such men. A

polygamous man may be simultaneously in legal union with one of his wives and in consensual union with another wife or other wives.

Divorced: an individual who has been separated from his or her spouse through a court decision, according to the legislation.

Separated: an individual who has separated temporarily from his/her spouse with or without intention to be back in marital union with him/her but without any court decision on the case.

Never married: an individual who has never been in a marital union.

Widowed: a man or a woman who has lost his or her spouse by death, not yet remarried.

The distinction between consensual union and monogamous union does not cover all types of unions. Moreover, the concept of monogamy is applicable in regard to legal unions as well as consensual ones.

Unofficial monogamy: An individual is said to be monogamous when he or she is married with one spouse and polygamous in the contrary situation (Louis Henry, 1981). In the context of this census, unofficial monogamy refers to the marital union where a man or woman is married unofficially to one spouse.

B.4. Housing and household characteristics

Housing unit: a separate and independent place of abode intended for habitation by a single household, or one not intended for habitation but occupied by a household at the time of the Census. The essential features of households are separateness and independence.

Household: the concept of the household is based on the arrangements in regard to food or other essentials for living. It consists of one or several persons who live in the same dwelling and share meals.

Private household: consists of one or more persons living together and sharing at least one daily meal. Persons in a private household may or may not be related or may constitute a combination of persons both related and unrelated. In order to facilitate analysis of the de jure population (usual residents) across thematic reports, private households were further categorised as follows:

- a) Households where there is at least one usual resident in the household (present or absent resident); and
- b) Households consisting only of visitors (e.g.: Households found during the Census in their holiday homes, etc.)

Subsequently, and across all thematic reports, any analysis of the characteristics of the private households will refer to the definition in (a) above.

Types of private households:

- **One-person household:** consists only of the head of the household.
- **Nuclear household:** refers to a household consisting entirely of a single family nucleus. It may be classified into married or unmarried couple, family with children or without children or single parent with children only.

- **Extended household:** people related to each other and living together but who do not form a nuclear family.
- **Composite household:** people not related to each other living together; extended or nuclear family living with non-relatives.

Institutional household: It comprises a group of persons who are being provided with institutionalised care, and includes educational institutions, health care institutions, military institutions, religious institutions, or institutions for the elderly or persons with disabilities. In the RPHC5, persons who were homeless on the night of the Census were also classified as belonging to an institutional household.

Head of household: S/he refers to a person recognised as such by other members of the household. Every private household has one and only one household head.

Structure: According to census purposes, a structure constitutes a building used for residence purposes. A structure can contain one or more dwelling units.

Types of habitat: there are six types of habitat for private households: clustered rural settlement (*umudugudu*)/old settlement, Integrated model villages, dispersed/isolated habitat, planned urban housing (cadastre), and spontaneous or squatter habitat (*Akajagari*).

Improved source of water: According to the latest definitions from the WHO/UNICEF Joint Monitoring Programme for water supply, sanitation and hygiene (JMP, 2017), improved sources of drinking water include: piped water (into dwelling, compound, yard or plot, to neighbour), public tap/standpipe, tube well/borehole, protected well, protected spring, rainwater collection, and packaged or delivered water. Contrary to the previous definition of MDGs, packaged water (bottled water and sachet water) and delivered water (tanker

truck and cart with small drum/tank) are treated as improved water sources according to SDGs definition.

Unimproved source of water: Any other source of drinking water which does not belong to the types of water defined above as improved is classified as unimproved source. This includes the following:

unprotected well, Unprotected spring, surface water (river, lake, dam, pond, stream, irrigation channel, etc.).

Housing tenure: refers to legal occupation of the dwelling. Usually, occupancy here is defined as owner, tenant, hire purchase, free lodging, staff housing or refugee/temporary camp settlement.

B.5. Migration and spatial mobility

Migration: Geographic and spatial mobility involving a relatively permanent change in usual residence between clearly defined political or statistical units. It has associated dimensions of time and space.

Internal Migration: Refers to migration across regional administrative boundaries within a country. Internal migration can be categorized by type (in-migration and out-migration) and directional flow (rural-urban, rural-rural, urban-rural, and urban-urban).

An in-migrant: Is a person who enters a migration-defining area by crossing its boundary from some point outside the area, but within the same country.

An out-migrant: Is a person who departs from a migration-defining area by crossing its boundary to a point outside it, but within the same country.

Lifetime Migration: Is the migration that occurs between birth and the time of the census. Thus, a lifetime migrant is one whose current district of residence is different from his or her district/country of birth, regardless of intervening migration.

Lifetime migrants: As defined in the UN's Manual VI (1970), lifetime migrants are those whose place of birth is not the same as the current place of residence. The number stated in this case is, however, an underestimation of both the number of migrations that the population has experienced and the number of migrants that have occurred during the lifetime of the living population. People who moved from the place of birth to a given place of destination and then returned before the Census date, as well as people who moved but died before the Census date, will not be counted.

Place of birth: According to the RPHC5 enumerator's manual, the place of birth is the usual place of residence of the mother at the time of the respondent's birth. This

question is meant to establish persons who are not enumerated in their places of birth and hence have migrated. Sometimes expectant mothers move from rural areas to urban areas for the delivery since maternity services are better in the towns. This kind of movement is short-lived and must not be confused with a migratory one.

Even though the district boundaries have changed over time, the objective is to relate a person's place of birth to the district as now constituted. For districts which have been split by administrative reform, enumerators were asked to find the actual district of birth and give its current name.

Recent Migration: Is the movement in the recent past of persons enumerated during the census, relative to their previous place of residence (5 years or less) prior to census. A recent migrant is one whose current district of residence is different from his or her previous place/district of residence, five years ago or less. Note that if the person was still living in the district, then he/she was not considered as a migrant

Previous place of residence: In the RPHC5 enumerator's manual, the previous place of residence is related to the name of the district in Rwanda in which respondents were living before August 2022. A person who may have been absent from home temporarily for some reason, such as visiting relatives or because of a stay in hospital, or who may have been overseas on a visit of less than six months, was shown where he or she normally lived before August 2022 (i.e. ignoring the temporary absence). If the person was living in another country before August 2022, the name pertaining to the specific country was used.

Duration of residence: The duration of residence is the length of time an individual has resided in the current district of residence up to the date of the Census. The duration of residence concerns the time lived in a given place/district of residence and not in a particular housing unit. In the enumerator's manual, the instructions are that if the duration is less than one year, it is to be recorded as zero, and if the respondent has lived in the current place of residence since his or her birth then the respondent's age is the duration of residence. In the case of a period which is over one year then the period is recorded in years.

Migration effectiveness: This is the ratio of net migration to gross migration. It is meant to display the magnitude of the effective addition (or loss) through migration to the overall gross movement. The Migration Effectiveness Index "measures the degree of (a)symmetry or (dis)equilibrium in the network interregional migration flows". It is the indicator commonly used to measure net migration as a proportion of gross migration turnover for any territorial/administrative unit. An index of migration effectiveness or effectiveness index is calculated as the ratio of net migration to total in- and out-migration. The range of the index is from zero, when arrivals and departures are equal in number, to one, when migration is entirely one way. A nation's population is redistributed through migration flows and counterflows between its constituent subnational areas, resulting in a geographical pattern of net migration gains or losses which may change from one time period to another.

Migratory efficiency index (MEI): Migration efficiency ratio is simply defined as the ratio of the net number of moves of individuals between areas to the gross number of moves that take place. It is suggested that the ratio of net to gross migration measures the efficiency of migration, such that a low ratio indicates a low efficiency and a high ratio indicates a high efficiency.

The MEI, which ranges from 1 to 100, quantifies the balance between regional flows and counterflows, with low values indicating largely reciprocal exchanges between regions, and high values suggesting strongly directional flows. A number between 0 and 100 where the higher number shows

an efficient mechanism of population redistribution. Measured at multiple geographical scales, MEI values are remarkably stable with scale when computed for 20 regions or more (Rees et al, 2017).

Gross migration: Gross migration is the total flow of migrants across an administrative border, i.e. in-migrants + out-migrants, or in the case of international migration, immigrants + emigrants. Net migration is the difference between the inward and outward flows of migration, i.e. in-migrants – out-migrants or immigrants – emigrants.

Net-Migration: This is the balance between in-migration and out-migration. According to direction of the balance, it may be characterized as net in-migration or net out-migration. Thus, net flow in or out is indicated by a plus (+) or minus (-) sign.

International migration: This is the process by which one changes his place of usual residence by crossing international boundaries into another country.

An emigrant: This is an international migrant, departing to another country by crossing an international boundary

An immigrant: This is an international migrant entering an area from a place outside the country. Immigrants cross national borders during their migration from the perspective of the country in which they enter.

Return Migration: This type of migration occurs when a return migrant (person) moves back to the area where he or she formerly resided.

Migration stocks and flows: The stock of internal/international migrants is the total number of internal/international migrants living in a district/country at a particular point in time, while the flow of internal/international migrants is the number of migrants entering or leaving a district/country over the course of a specific time period (e.g. one year). District/country of birth and citizenship are the main criteria used for categorizing different types of population stocks and flows, with duration of stay providing a further element for statistics on migration flows.

B.6. Education

Early childhood development (ECD): is defined as a comprehensive approach to policies and programs for children from birth to eight years of age, their parents, and caregivers, aimed at protecting the child's rights to develop his or her full cognitive, emotional, social, and physical potential. In Rwanda, this usually refers to the age group 0–6 years.

School attendance and attendance rates: School attendance is defined as regular attendance at any regular accredited educational institution or program, public or private.

There is a difference between 'attending school' and being 'enrolled in school'; thus results from censuses and administrative data may differ.

School attendance is complementary to but must be distinguished from 'school enrolment', which typically is obtained from administrative data. A child can be enrolled in school but not necessarily be attending. It is recommended that these concepts be clearly defined so that countries can determine which variable they wish to collect via the census.

Net Attendance Ratio (NAR): attendance of the official age group for a given level of education expressed as a percentage of the corresponding school-age population. The NAR for primary school is the percentage of the primary school-age population (6–11) attending primary school. The NAR for secondary school is the percentage of the secondary school-age population (12–17) that is attending secondary school. By definition, the NAR cannot exceed 100%.

Gross Attendance Ratio (GAR): total attendance in a specific level of education, regardless of age, expressed as a percentage of the corresponding school-age population. The GAR for primary schools is the total number of primary school students, expressed as a percentage of the official primary school-age population. The GAR for secondary schools is the total number of secondary school students, expressed as a percentage of the official

secondary school-age population. If there are significant numbers of overage and underage students at a given level of schooling, the GAR can exceed 100%.

Gender Parity Index (GPI): ratio of the number or proportion of the female population to the male population for a given indicator. It measures gender equality between girls' and boys' performance in school.

Educational attainment: Educational attainment is defined as the highest grade completed within the most advanced level attended in the education system of the country where the education was received.

Educational qualifications (level of education): Qualifications are the degrees, diplomas, certificates, professional titles, and so forth that an individual has acquired, whether by full-time study, part-time study, or private study, whether conferred in the home country or abroad, and whether conferred by educational authorities, special examining bodies or professional bodies. The acquisition of an educational qualification, therefore, implies the successful completion of a course of study or training program.

According to national needs, information on qualifications may be collected from persons who have reached a certain minimum age or level of educational attainment. Such information should refer to the title of the highest certificate, diploma, or degree received.

Academic degree obtained: An academic degree is a college or university diploma, often associated with a title and sometimes associated with an academic position, which is usually awarded in recognition of the recipient having either satisfactorily completed a prescribed course of study or having conducted a scholarly endeavor deemed worthy of his or her admission to the degree. The most common degrees awarded today are Diploma, Advanced Diploma, Bachelor's,

Master's, and doctoral (PhD) degrees. Most higher education institutions generally offer certificates and several programs leading to the awarding of a Master of Advanced Studies, which is predominantly known as a Diplôme d'études supérieures specialises under its original French designation. The certificates listed below are some of the certificates currently or previously awarded by the Rwandan education system:

Primary Leaving Certificate: a certificate awarded upon successful completion of six years of primary school. This certificate provides access to lower secondary education.

Ordinary 'O' Level Certificate: a certificate awarded upon successful completion of three years of lower secondary school. This certificate provides access to senior secondary education.

TVET Certificate I: the duration to get the certificate is 3 to 9 months. There is no further educational prerequisite for enrollment to study at this level other than having reached the age of 16 years. Graduates at this level will have the basic practical skills and competencies required to carry out a specific task in the labor market.

TVET Certificate II: the duration to get the certificate is 1 year. The minimum age to study at this level is 16 Years and one has completed at least primary six. Graduates at this level will have practical skills and a set of competencies required to carry out different tasks in the labor market or to pursue further learning.

TVET Certificate III: the duration to get the certificate is 1 year. To study at this level you must have completed 9 Years Basic Education or have an equivalent qualification. At the completion of this level, students will have practical skills and knowledge enabling them to proceed to TVET Level 4. This certificate is given to people who completed 1 year of technical secondary education and who decided to enter the labor market.

TVET Certificate IV: the duration to get the certificate is 1 year. The minimum requirement to

study at this level is to have completed Level III. At the completion of this level, students will have practical skills and knowledge enabling them to proceed to TVET Level 4. This certificate is given to people who completed 2 years of technical secondary education and who decided to enter the labor market.

TVET Certificate V/ Professional Certificate of Secondary Education A2 (Technical secondary education): a certificate awarded upon successful completion of three years of senior secondary school in technical secondary education. The minimum requirement to study at this level is to have completed Level IV. Graduates at this level will have advanced practical skills and knowledge enabling them to join the labor market or proceed to higher Education.

Advanced General Certificate of Secondary Education A2 (general secondary education): a certificate awarded upon successful completion of three years of senior secondary school in general secondary education.

NB: The Advanced General Certificate of Secondary Education and Professional Certificate of Secondary Education A2 grant access to higher education.

ENTA (Ecole Normale Technique Auxiliaire) – a certificate awarded upon successful completion of five years of secondary school. This type of certificate is no longer available;

A3/D4/D5 – certificates awarded upon successful completion of three, four, or five years of secondary school. This type of certificate is no longer available.

A2/D6/D7 – certificates awarded upon successful completion of six or seven years of secondary school.

Post-primary education: In the past, this level of education targeted technical skills and allowed students, after successfully completing three years of study to enter the labor market. Some disaggregations by highest level attended may group post-primary and secondary education. The

following certificates and/or diplomas were awarded at this level of education:

EMA (Ecole des Moniteurs Auxiliaire) – a certificate awarded upon successful completion of two years of post-primary education, when this level existed in the education system.

CE/FM (Certificat d'Edute Familiale) – a certificate awarded upon completion of three years of post-primary education. The courses associated with these certificates were exclusive to the female population.

CERAI (Centre d'Enseignement Rural Artisanal Intégré) – a certificate awarded upon successful completion of three years of post-primary education.

Tertiary Education: The duration of tertiary education varies between three and six years according to the institution and the field of study. The following certificates and/or diplomas were or are currently awarded at this level of education:

A diploma and an Advanced Diploma program: are between two and three years in length. Admission requires an upper-secondary qualification like the Certificate of Technical Secondary Education A2. In addition, the HEC defines certificate and diploma qualifications as exit qualifications in incomplete bachelor's programs rather than distinct study programs. Students who complete one year of study (120 credits) before dropping out may receive a Certificate of Higher Education, whereas students who complete 2 years of studies and obtainment of at least 240 credits may be awarded a Diploma and students who completed 2,5 years of studies and obtainment of at least 300 credits may be awarded an Advanced Diploma in Higher Education in Higher Education.

Bacc/diploma: a degree previously awarded upon successful completion of two years of university. It is no longer available.

Bachelor's: a degree awarded upon successful completion of four years of university. In Rwanda,

the Bachelor's programs are offered for three-five years and each year is split into semesters or trimesters depending on the specifications of the programs.

Master's: a degree awarded to a university graduate upon his/her successful completion of at least one year of post-graduate studies. In Rwanda, the duration of Masters' Programs varies between eighteen (18) and twenty-four (24) months, except in Medicine, where they last for four years. They are offered by coursework or purely by research.

PhD: a degree awarded to a university graduate upon his/her successful completion of a doctoral program, usually lasting between three and four years.

School Life Expectancy (primary to tertiary education): SLE is the total number of years of schooling (primary to tertiary) that a child can expect to receive, assuming that the probability of his or her being enrolled in school at any particular future age is equal to the current enrolment ratio at that age. Caution must be maintained when utilizing this indicator in international comparisons. For example, a year or grade completed in one country is not necessarily the same in terms of educational content or quality as a year or grade completed in another country. SLE represents the expected number of years of schooling that will be completed, including years spent repeating one or more grades.

Literacy: Literacy is the ability to both read and write with understanding. A literate person is one who can both read and write a short, simple statement about his or her everyday life. An illiterate person is one who cannot, with understanding, both read and write such a statement. Hence, a person capable of reading and writing only figures and his or her own name should be considered illiterate, as should a person who can read but not write as well as one who can read and write only a stock phrase that has been memorized. In the 2022 Census, literacy is recorded in the following languages: Kinyarwanda, English, French, Swahili and Other.

B.7. Employment/economic activity

The main concepts and definitions used in the census are in line with the international standards on statistics of work, employment, and labour underutilization adopted by the 19th International Conference of Labour Statisticians (Geneva, 2013).⁷ They are briefly described below.

Work: work is defined as:

- “Any activity performed by persons of any sex and age to produce goods or to provide services for use by others or for own use” in line with the General production boundary defined in the System of National Accounts 2008.
- Work is defined “irrespective of its formal or informal character or the legality of the activity.”
- It excludes “activities not involving production of goods or services (begging, stealing), self-care (personal grooming, hygiene) and activities that cannot be performed by another person on one’s own behalf (sleeping, learning, own recreation).”

The international standards recognize different forms of work: Own-use production work (production of goods and services for own final use); employment (work performed for others in exchange for pay or profit); unpaid trainee work (work performed for others without pay to acquire workplace experience or skills); volunteer work (non-compulsory work performed for others without pay); and other forms of work (not defined at this time by the international standards).

Working age population: The working age population in Rwanda is defined as all persons 16 years old and over.

Employment: Employment is a particular form of work. Persons in employment are defined as all those above a specified age who, during a short reference period, were engaged in any activity to produce goods or provide services for pay or profit. It excludes persons engaged wholly in activities to produce goods or services for own final use such as producing agricultural, fishing and gathering products for own-consumption or cleaning, decorating, gardening and maintaining one’s own

dwelling or premises, durables and other goods. Persons in employment comprise: (a) employed persons “at work,” i.e., who worked in a job for at least one hour; and (b) employed persons “not at work” due to temporary absence from a job, or to working-time arrangements (such as shift work, flexi-time and compensatory leave for overtime).

Status in employment: Status in employment classifies jobs held by persons at a given point of time with respect to the type of explicit or implicit contract of employment of the person with other persons or organizations. The International Standard Classification of Status in Employment (ICSE-1993) identifies five main categories of persons with respect to their status in employment⁸: Employee, paid apprentice/Intern; employer; Own-account worker; Member of cooperative; Contributing family worker

Branches of economic activity: Branch of economic activity refers to the activity of the establishment in which an employed person worked during the reference period. An establishment may be a farm, a mine, a factory, a workshop, a store, an office or a similar type of economic unit. It is important to distinguish enterprises from establishments. “Enterprise” is a broader concept than “establishment”. An enterprise is a legal entity (or group of legal entities) and may have a number of establishments with different economic activities and different locations.

Occupation: Occupation refers to the kind of work done by a person irrespective of the branch of economic activity or the status in employment of the person.

Occupational segregation index: It is an indicator that measures the extent to which labour markets are separated into “male” and “female” occupations. The occupational segregation index (D) is commonly used as a proxy indicator for equality of opportunity in employment and occupation.⁹ It is defined by

⁷ILO, *Resolution concerning statistics of work, employment and labour underutilization, 19th International Conference of Labour Statisticians, Geneva, October 2013.*

⁸ILO, *International Classification of Status in Employment, ICSE-93, Fifteenth International*

Conference of Labour Statisticians, Geneva, <http://laborsta.ilo.org>.

⁹ILO, *Decent Work Indicators Concepts and definitions, ILO Manual (First version), May 2012, pp. 127-130.*

$$D = \frac{1}{2} \sum_i \left| \frac{n_{Ai}}{n_A} - \frac{n_{Bi}}{n_B} \right|$$

Where n_{Ai} and n_{Bi} are, respectively, the number of men and women in a given occupational i and n_A and n_B are, respectively, the total number of men and women in all

occupations. The value of the index ranges from zero to one, zero indicating no segregation and one indicating complete segregation. The index may be interpreted as the fraction of persons that need to change occupations to achieve zero segregation.

B.8. Socio-cultural characteristics

Religion: Religion originates in an attempt to represent and order beliefs, feelings, imaginings and actions that arise in response to direct experience of the sacred and the spiritual (Connelly, 1996). Affiliation to a religion entails adherence to its fundamental beliefs and the frequenting of liturgical services and other duties expected of an active member (Ellway, 2005). Religions commonly are taken to provide general orientation in regard to the way one lives one's life (Fasching et al., 2001). The main religions existing in Rwanda and taken into account during the RPHC5 are the following:

The Catholic Church: The Christian Catholic Church is characterised by an Episcopal hierarchy with the Pope at its head and belief in seven sacraments and the authority of tradition. The authority of the church lies within the hierarchy of the church and the truth is found in the Bible.

ADEPR (Associations des Eglises Pentecostes au Rwanda): ADEPR is the first pentecostal church established in Rwanda. It has born in 1983 as a result of the association of different pentecostal denominations that had been originally established by Swedish missionaries since 1920 and progressively expanded in different parts of Rwanda. ADEPR share the same beliefs as most of protestant churches and its main mission is the expansion of Christ centered evangelism.

Islam: Islam was founded in 622 CE by the Prophet Muhammad, in Makkah (also spelled 'Mecca'). The two sacred texts of Islam are the Qur'an, which are the words of Allah 'the One True God' as given to Muhammad, and the Hadith, which is a collection of Muhammad's sayings.

Protestantism: The term *Protestant* was not initially applied to reformers in the sixteenth century but came to be used to describe all groups protesting against the Roman Catholic orthodoxy. Thus, the term *Protestant* is often used as a general term merely to signify Christians

who belong to none of the churches of the Catholic tradition. Most Protestants believe Baptism that is an outward testimony of a prior inward regeneration, usually done after a person confesses Jesus Christ as their saviour and obtains an understanding of the significance of Baptism. Here, there are the churches that are in CEPR(Conseil Protestant du Rwanda)

Seventh-Day Adventist Church: The Seventh-Day Adventist Church is a Protestant Christian denomination originating in the mid-nineteenth century in the northeast United States. The Adventist Church among Protestant Christian denominations is the observance of the Sabbath on Saturday, the seventh day.

Other Christian churches: Other Christian churches are Protestant churches that were established in Rwanda after 1994 and do not belong to the CPR(Conseil Protestant du Rwanda).

Jehovah's Witnesses: The religious beliefs of Jehovah's Witnesses are in many ways similar to those of mainstream Christians but they believe that after the resurrection they will live in this world but renewed. Moreover, Jehovah's Witnesses are permitted most forms of medical treatment, but under no circumstances must they ever have a blood transfusion.

Traditionalist/Animist Religion: The term 'animism' is usually applied to any religious belief that recognises spirits or a spirit world as inherent and controlling within the physical world. Some spirits are the souls of deceased ancestors, while others are beings inherent in nature and the spirit realm. For some people the spirits are intermediaries between humans and a higher god.

Other religion: these are religions which are not Christian and which are not Christian and which do not belong to the other religions mentioned above.

Nationality: Under the idea of ‘nationality’, people construct symbolically a referent of their identity (Brubaker, 1992), which entails a place or territory seen and understood geographically as a space wherein people have something in common.

Nationality means the state of being legally a citizen of a particular country or the legal right to belong to a particular nation whether by birth or naturalisation. Types of nationality are identified as single and dual

nationality, the latter of which refers to the state of being a citizen of two countries.

Nationality and citizenship are two terms that are sometimes used interchangeably (Lynn, 2007) and some people even use the two words – ‘citizenship and nationality’ – as synonyms. However, they differ in many aspects. Simply put, nationality can be applied to the country where an individual was born while citizenship is a legal status, which means that an individual has been registered with the government in a particular country.

ANNEX C: SUPPLEMENTARY TABLES

Table C.1: Household headship rates among private households by five-year age-group and by sex and area of residence

Household head's Age-group	Urban			Rural			All Rwanda
