SEASONAL AGRICULTURAL SURVEY

2023

ANNUAL REPORT

EXECUTIVE SUMMARY

This is the annual report for the Seasonal Agricultural Survey (SAS) conducted by the National Institute of Statistics of Rwanda (NISR) for the agricultural year 2022/2023, which covers three primary agricultural seasons in Rwanda. The main agricultural seasons include Season A, spanned from September 2022 to February 2023, Season B which started from March to June 2023, and Season C which started from July to September 2023.

Data sources

SAS is a primary-based data survey, combining area frame and a list frame. It covered 1,200 segments and 345 large scale farmers. It is conducted in two distinct phases: Screening and Harvesting phases. The screening phase covers grown crops data, estimates on cultivated area, and erosion control measures on plots. The harvesting phase covers interviews from farmers who grew crops in that specific season. It covered 22,971 plots and 345 large-scale farms for season A, and 23,007 plots and 333 large-scale farmers for season B, specifically targeting plots with crops ready for harvest in respective seasons. Estimates for major crops are prepared mainly to give timely and current district and national totals and averages. Survey primary data are supplemented by tea and coffee data from National Agricultural Export Development Board (NAEB) collected through the routine activities of monitoring coffee and tea production, and coffee census conducted every five years.

Key findings

A comprehensive summary of the primary indicators assessed during SAS 2023 is presented in Table 0. It includes crop production, yield estimates, land use, use of agricultural inputs and agricultural practices.

Land use

The total country land area is estimated at 2.377 million of hectares for which 1.367 million hectares (57.5% of total country land) is used for agriculture. In 2023 Season A, 1 million hectares were used for Seasonal crops, 0.5 million hectares were covered by permanent crops, while 0.126 million hectares were used for permanent pasture. Likewise, in season B, the total country land area is estimated at 2.377 million of hectares for which 1.345 million hectares (56.6% of total country land) is used for agriculture. In addition, 983,000 hectares were used for seasonal crops, 540,000 hectares were covered by permanent crops, while 124,000 hectares were used for permanent pasture.

Use of inputs

Commonly used agricultural inputs include improved seeds, organic and chemical fertilizers, as well as pesticides/fungicides. The 2023 results indicate that 37.1 percent of farmers in season A, 20.8 percent in season B, and 20.7 percent in season C used improved seeds. In season A, 87.9 percent of farmers applied organic fertilizer, 83.4 percent in season B, and 83.7 percent applied organic fertilizers in season C. In addition, 59.6 percent of farmers applied inorganic fertilizer in season A, 51.6 percent of farmers applied

inorganic fertilizer in season B while 74.5 percent in season C. In regard to use of pesticides, in season A of 2023, 34.5 percent of farmers applied pesticides in season A, 29.7 percent in season B and 69.3 percent in season C.

Agricultural practices

In season A of 2023, 10.3 percent of farmers practiced irrigation compared to 9.6 percent of farmers in season B and 64.6 percent in season C. In 2023 Season A, 92.1 percent of farmers practiced anti-erosion activities, compared to 91.6 percent of farmers in season B and 94.8 percent of farmers in season C.

FOREWORD

Since 2012, the National Institute of Statistics of Rwanda (NISR) is conducting the Seasonal Agricultural Survey (SAS) in order to provide timely and accurate estimates on the national crop production, cultivated and harvested area, crop yield, agricultural inputs, and agricultural practices crucial for monitoring progress on agriculture programs and policies in Rwanda. This survey is conducted in close collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI), the National Agricultural Export Development Board (NAEB), and the Rwanda Agriculture and Animal Resources Development Board (RAB).

This published report underscores the significance of the Seasonal Agricultural Survey (SAS) as a crucial tool for monitoring national agricultural programs. By providing essential information, the SAS informs policymakers and stakeholders in effectively identifying priority intervention areas, addressing key agricultural issues.

I am grateful to NISR staff and other stakeholders who worked tirelessly to ensure the 2023 Seasonal Agricultural Survey was successfully implemented. Their commitment and hard work are greatly appreciated.

Therefore, I recommend stakeholders, government, researchers, partners, and the general public to optimally make use of the findings of this report.

MURANGWA Yusuf
Director General, NISR

Table 0. Summary of Seasonal Agricultural Survey main indicators

I. INTRODUCTION

Agriculture continues to be one of the most important pillars of economic growth for Rwanda, and a much emphasis for agriculture transformation has been underpinned under the new national development strategy (NST-1, 2018). In recognition of its potential in economic development, food security and poverty reduction, the government has set an ambitious agricultural agenda under the new strategy for transformation of agriculture (PSTA 4) aiming at transformation of Rwandan agriculture from a sector characterised by low productivity to a sector using knowledge to increase productivity and investing in value addition and commercialization.

Quality agriculture statistics are useful in monitoring the performance of national agricultural programs and hence, imperative for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. In this regard, the National Institute of Statistics of Rwanda (NISR) in collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI) conducts the Seasonal Agricultural Survey (SAS) to gather agriculture information mainly related to potential agricultural land use; crop area, crop yield and production; agricultural inputs and practices as well as other agricultural statistics.

The survey data are supplemented by administrative records collected by the National Agricultural Export Development Board (NAEB) through routine activities of monitoring coffee and tea production. Other agriculture data is obtained from MINAGRI and Rwanda Agriculture and Animal Resources development Board (RAB), district agronomists, and other partners working in the agriculture sector, including total quantity of agricultural inputs used, total agricultural exports, crop varieties grown, crop intensification program among others. Seasonal Agricultural Survey (SAS) covers three main agricultural seasons: Season A (September to February of the following year), Season B (March to June) while Season C (July-September) is a shorter season mainly for vegetables, sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

1.1. Objective of the Survey

The main objective of SAS is to provide timely, accurate, reliable and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda mainly in terms of land use, crop area, yield and crop production. The survey results are useful to monitor the current agricultural and food supply conditions and facilitate evidence-based decision making for the development of the agricultural sector. This report presents the findings of 2023 agricultural year related to:

1. Land use:
 - Agricultural land: includes land already used for farming and land that can be brought back into cultivation (fallow or pasture land). Agricultural land indicates land potential for agriculture.
 - Arable land: land able to be grown and produce crops for food and feeds supply purpose. This area excludes land under permanent crops¹ and permanent pasture.
 - Physical crop cultivated area: area occupied with crops.
 - Pasture land: area under natural grasses reserved for livestock or occupied with fodder crops;
 - Fallow land: cultivable land free for cultivation in a temporal period (less than 5 years);
2. Crop land: Cultivated land devoted to each cultivated crop.
3. Crop production: Quantity of harvested crop produce used for food, livestock feeds, seeds, etc (quantified into kilograms or tons.)
4. Crop yield: It is a measurement of the quantity of crop harvested per unit of land area (kg per hectare). It is used to determine the efficiency of food production at a certain period.
5. Use of inputs (this assesses the level of use of improved seeds, fertilizers and pesticides)
6. Agricultural practices (practice of irrigation and soil protected against erosion) and others.

¹ Permanent crops are crops produced from plants which last for many seasons, rather than being replanted after each harvest. Those crops are fruit trees, sugar cane, coffee, tea, banana, tree plantations, nuts trees among others).

II. SURVEY DESIGN

2.1. Sample frame design

To provide the basis for conducting probability surveys based on complete coverage of the farm level, and as a better way of collecting agricultural data and find better precise survey estimates, SAS uses a Multiple-Frame Sampling (MFS) methodology by which, area frame is constructed, and survey sample is drawn from it. In addition, a list frame of large-scale farmers (LSF), with at least 10 hectares of agricultural holdings is done to complement the area frame to cover crops mostly grown by large scale farmers which are not easily covered in area frame. To construct area frame, the process involves the following two steps: land cover classification, land stratification and sampling of segment.

2.2. Land classification

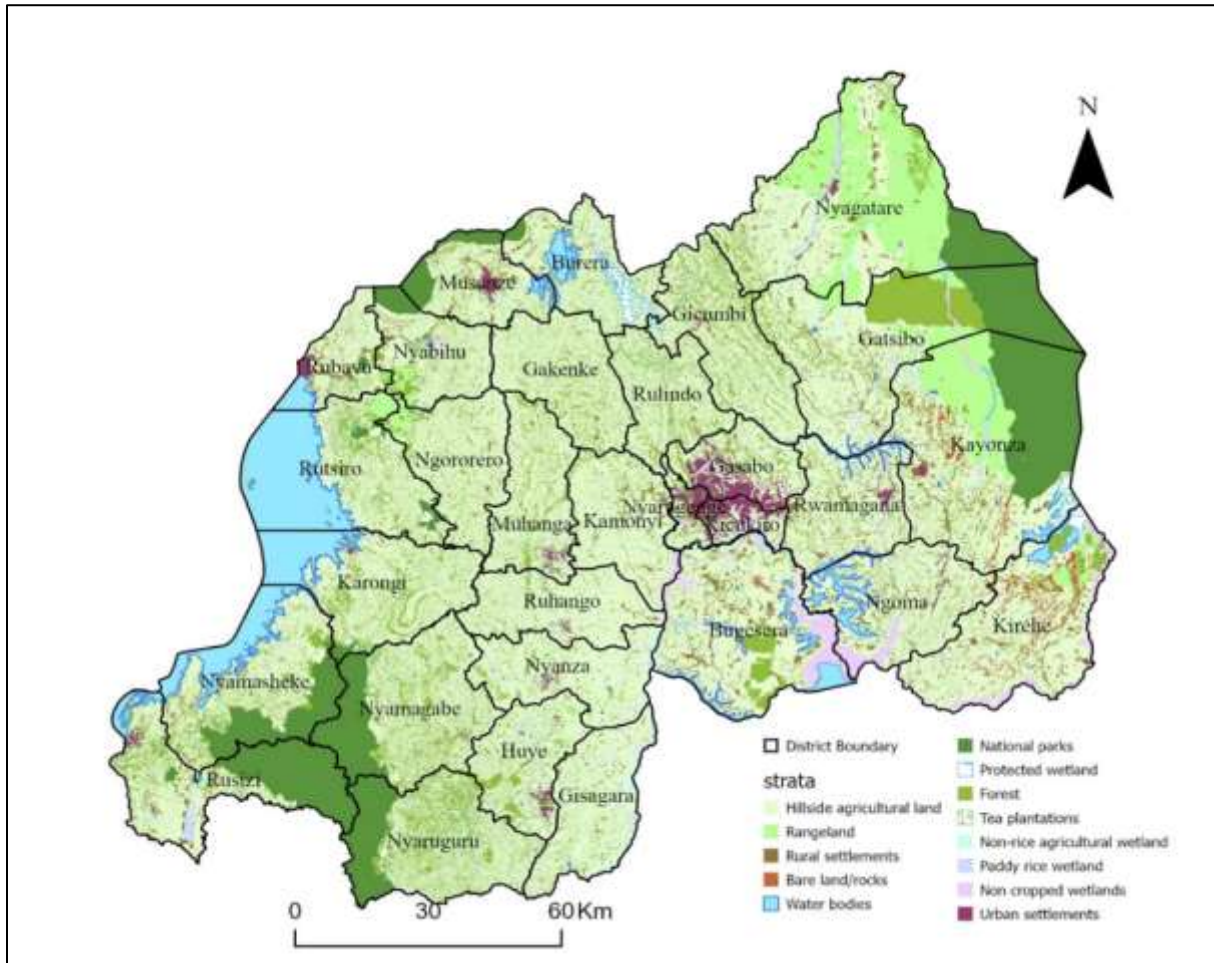

Land classification was done using Rwanda land cover map which is a combination of different layers available in the country, plus a photo interpretation of a series (2010 to 2020) of high-resolution satellite images from Worldview. The Rwanda land cover map is divided into 13 land cover classes (as shown in Table 1).

Table 1: List of Rwanda land cover classes

Code	Land cover class name	Area (Ha)	Percentage share
1.0	Consolidated tea plantations	17,821	0.70
1.1	Hillside agricultural land	1,343,933	53.10
2.1	Non-rice agricultural wetlands	55,807	2.20
2.2	Paddy rice wetlands	21,848	0.90
2.3	Non cropped wetlands	37,743	1.50
3.0	Rangeland	144,490	5.70
4.1	Urban settlements	31,612	1.20
4.2	Rural settlements	78,928	3.10
5.0	Bare land/rocks	15,404	0.60
6.0	Water bodies	135,295	5.30
7.0	National parks	241,455	9.50
8.0	Protected wetlands	12,201	0.50
9.0	Forest plantations	395,001	15.60

Source: NISR, SAS 2023

Map 1: Rwanda land classification map

Source: NISR, SAS 2023

Among 13 land cover classes, some of them are related to agricultural activities. The next step of building the area sample frame was to group land cover classes into strata in order to identify agricultural strata to be considered in sample frame.

2.2.1. Stratification

Out of thirteen land cover classes, five are considered for the agricultural survey frame. These classes are tea plantation, hillside agricultural land, non-rice agricultural wetlands, paddy rice agricultural wetlands, and rural settlement. The remaining land cover classes are considered as excluded from the frame of land potential for agriculture. The sampling frame is made of a set of square clusters (segments) of 9 hectares each covering the whole country. By overlapping the clusters layer with land cover classes layer, each cluster is assigned a dominant land cover class as a stratum definition, basing on a defined threshold as follow:

Table 2: List of strata

Stratum code	Stratum name	Definition
1.0	Dominant hill crop land	Clusters with Hillside agricultural land cover class greater or equal to 60 percent of the total area of the cluster
2.0	Dominant Wetland crops	Clusters with non-rice wetland land cover class greater than 25 percent of total area of the cluster
3.0	Dominant rangeland	Clusters with rangeland land cover class greater or equal to 60 percent of the total area of the cluster
4.0	Mixed	The rest of other possible combinations
9.0	Excluded	All clusters with excluded land cover classes greater or equal to 50 percent of the total area of the cluster

Source: NISR, SAS 2023

In addition, tea plantation class data which are recorded by the National Agricultural Export Development Board and large-scale farms which are completely enumerated during the Seasonal Agricultural Survey, were not considered in the agricultural strata taken in sample frame. This means that only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum were considered as area frame from which a sample segment was selected.

Table 3: Number of segments (Population size) per district by stratum

	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum	Excluded stratum	Total

2.3. Sampling procedures

Out of five defined agricultural strata, only dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum are considered as land potential for agriculture. The remaining stratum is the non-agricultural land. Note that clusters covered by tea plantations are not considered in the area sample frame due to reasons stated above. Thus, SAS is conducted on 4 above mentioned strata to cover other major crops where a total of 1,200 segments constitutes the SAS sample.

At first stage, 1200 segments are selected and allocated at district level based on the power allocation approach (Bankier, 1988²). Sampled segments inside each district are distributed among strata with a proportional-to-area criterion.

Table 4: Allocation of sampled segments per district by stratum

District	Stratum				Total A & B	Season C
	Dominant hill crop land	Dominant wetland crops	Dominant rangeland	Mixed stratum		
Nyarugenge	12	6	-	2	20	10

² Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. The American Statistician, Vol. 42, n. 3 pp. 174-177.

At second stage, 25 sample points were systematically selected, following a special distance of 60 meters between points. Sample points are reporting units within each segment, where enumerators go to every point, locate and delineate plots in which the sample points fall, and collect records of land use and related information.

The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

Map 2: Map showing square cluster(segment) with 25 sampled points

Source: NISR, SAS 2023

2.3.1. Weighting Procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

Where:

p_{1h} = probability of selection of sample segments in stratum h (district by stratum)

n_h = number of sample segments selected in stratum h

N_h = Total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hij}}{A_{hi} \times g_{hij}}$$

Where:

- p_{2h} = Probability of selection of the plot in segment h
- g_{hi} = Number of grid squares selected in the i-th sample segment of stratum h;
- A_{hij} = Area of the j-th sample plot selected in the i-th sample segment of stratum h
- A_{hi} = Area of the i-th sample segment of stratum h;
- g_{hij} = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phij} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

Where:

W_{Phij} = weight for the j-th sample plot in the i-th sample segment in stratum h

2.3.2. Sampling Errors Computation

In order to examine the precision of the most important estimates from the 2022/23 SAS data and the statistical efficiency of the agricultural area frame and sample design, it is important to calculate the sampling errors and corresponding coefficients of variation (CVs) for these estimates, such as the total area in each major crop. The sampling error of each estimate is measured by the standard error, or square root of the variance. The Complex Samples module of SPSS and Stata use a linearized Taylor series variance estimator that takes into account the stratification and clustering in the sample design.

The SPSS Complex Samples software had been used to calculate the sampling errors and CVs for estimates of the total area of major crops from the SAS data.

The formula for the estimate of a total can be expressed as follows:

$$\hat{Y} = \sum_{h=1}^L \sum_{i=1}^{n_h} \sum_{j=1}^{m_{hi}} W_{hi} y_{hij} ,$$

where:

- L = number of strata
- y_{hij} = value of variable y for the j-th sample household in the i-th sample segment in stratum h

The variance estimator for a total used by the Complex Samples module of SPSS and Stata can be expressed as follows:

Variance Estimator for a Total

$$V(\hat{Y}) = \sum_{h=1}^L \left[\frac{n_h}{n_h - 1} \times \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right],$$

where:

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W_{hi} y_{hij}$$

y_{hij} = value of variable y for the j -th sample plot in the i -th sample segment of stratum h

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

The survey estimate of a ratio is defined as follows:

$$\hat{R} = \frac{\hat{Y}}{\hat{X}},$$

where \hat{Y} and \hat{X} are estimates of totals for variables y and x , respectively, calculated as specified previously.

In the case of a stratified two-stage sample design, means and proportions are special types of ratios. In the case of the mean, the variable X , in the denominator of the ratio, is defined to equal 1 for each unit so that the denominator is the sum of the weights. For a proportion, the variable X in the denominator is also defined to equal 1 for all units; the variable Y in the numerator is binomial and is defined to equal either 0 or 1, depending on the absence or presence, respectively, of a specified characteristic for the unit.

The variance estimator for a ratio used by SPSS Complex Samples and Stata can be expressed as follows:

Variance Estimator for a Ratio

$$V(\hat{R}) = \frac{1}{\hat{X}^2} \left[V(\hat{Y}) + \hat{R}^2 V(\hat{X}) - 2 \hat{R} COV(\hat{X}, \hat{Y}) \right],$$

where:

$$COV(\hat{X}, \hat{Y}) = \sum_{h=1}^L \left[\frac{n_h}{n_h - 1} \times \sum_{i=1}^{n_h} \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right) \right]$$

$V(\hat{Y})$ and $V(\hat{X})$ are calculated according to the formula for the variance of a total.

An example of a ratio calculated from the SAS data is average area per plot for a particular crop. In this case the variable Y in the numerator corresponds to the weighted total area for the particular crop, and the variable X in the denominator refers to the weighted total number of plots. Therefore, x_{hij} is equal to 1 for all sample plots with that crop, and 0 for plots that do not have that crop.

The sample of segments and plots selected for SAS 2022/23 is only one of the samples that could have been selected from the same area sampling frame, using the same design and size. Each of these samples would yield results that differ somewhat from the results based on the actual sample selected. Sampling errors are a measure of the variability between the estimates from all possible samples. The extent of variability is not known exactly but can be estimated statistically from the survey data. The sampling error is measured by the standard error, which is equal to the square root of the variance of an estimate.

A practical measure of precision is the coefficient of variation (CV), which is defined as the standard error divided by the value of the estimate. Therefore, it is a relative measure of the sampling error as a percent (or proportion) of the value of the estimate. A CV within 10% generally indicates that the level of precision for the indicator is good, and a CV of 15% may still be acceptable. However, if the CV of an estimate is above 20%, the estimate can be considered less reliable.

Another useful measure of precision is the 95% confidence interval. This is calculated as follows:

$$\hat{Y} \pm 1.96 \times se(\hat{Y})$$

where:

$se(\hat{Y})$ is the standard error of the total estimate \hat{Y}

This 95% confidence interval gives a lower and upper limit for the estimate and indicates that there is a 95% chance that the true value of the estimate is within this range. The width of the confidence interval also indicates whether the level of precision provides useful information. If the confidence interval is too wide, the estimate will be less useful. The value following the (\pm) sign in the formula is referred to as the margin of error, which is another measure of precision related to the width of the confidence interval.

The design effect is defined as the variance of an estimate based on the actual complex sample design divided by the corresponding variance from a simple random sample of the same size. It is a measure of the relative statistical efficiency of the sample design, taking into account both the stratification and clustering in the sample design. Clustering generally increases the design effect due to the intra-cluster correlation of plots within the segments. At the same time, the land-use stratification of the segments will decrease the design effects because it is more efficient than a simple random sample.

The presence of clustering typically increases the design effect, owing to the intra-cluster correlation of plots within the segments. Simultaneously, the land-use stratification of the segments tends to decrease the design effects, as it proves to be more efficient than a simple random sample. This dual consideration of both factors provides a comprehensive assessment of the efficiency of the sample design in capturing the nuances of the area under cultivation. The estimates of the total area of major crops at the national level and the corresponding measures of precision (standard error (SE), the coefficient of variation (CV), the 95 percent confidence interval, the design effect (DEFF), and number of unweighted observation (n of sample plots)) from the SAS 2022/23 data are presented in Table 77 to Table 79 on the Annexes.

2.4. Data Collection design

Data collection for SAS 2023 was carried out in two distinct phases (screening and harvest) within each of the three regular seasons. The initial phase, called the screening activity (post-planting phase), involved marking plots with sampled points within selected segments to gather information on land use, cultivated land area, and crop types. The second phase focused on collecting production data by interviewing small-scale farmers in selected plots, as well as engaging with all Large-Scale Farmers (LSF). For the successful execution of SAS data collection, 137 Enumerators and 23 Team Leaders were involved and underwent thorough training before each season's data collection. Additionally, NISR staff provided regular supervision during data collection to maintain data quality.

2.4.1. Time frame

The SAS data collection covered three regular agricultural seasons, as illustrated in figure 1. Specifically, for the 2023 season A, data collection activities started on 4th December 2022 to 16th February 2023, season B, on the other hand, started on May 2 and concluded on June 30, 2023. Throughout both seasons, data were collected in 1,200 segments and 336 large-scale farmers' holdings across the country. Additionally, Season C data collection took place from September 10 to September 30, 2023, covering 2,143 sites with the potential for growing Season C crops, along with 513 segments.

Figure 1: Agricultural seasons calendar

Source: NISR, SAS 2023

2.5. Data collection tools and materials

SAS used two questionnaires, the Screening and Plot questionnaires, digitalized using the CS Entry application (version 7.7):

- **Screening Questionnaire:** Used to collect information for the delineated plot mainly related to land use, plot area and cultivated crops.
- **Plot Questionnaire:** Used during farmer interviewing to collect information on the sampled plots mainly related to crop production, agricultural inputs and practices.

Besides, there two other GIS-based applications used:

- **Collector:** GIS-based application used to identify and navigate the enumerator team to the exact GPS sample-point location and for mapping the plot boundary for GIS area determination,
- **Survey 123:** which is GIS based application, used to collect data for LSF during screening activity.

Furthermore, there are other field materials used including, instructions' manual, android tablets, charger, power banks, pens, notebooks, pencils, calculator, weighing scales as well as Global Positioning System (GPS).

2.5.1. Field data collection procedures

The SAS data collection is carried out into two phases:

- **Screening activity:** During the screening activity, enumerators use GPS to navigate to the sampled point within the segment. Arriving at the sampled point, enumerators identify plot boundary with the guidance of the farmer and delineate the plot using the collector application with GPS connected to the tablet. For large scale farmers, the team ensures a complete enumeration of plots with at least 10 hectares.
- **Farm Interview:** After screening activity, only sampled agricultural plots are provided to enumerators for collecting crop production data using the plot questionnaire.

2.6. Data processing and analysis

CAPI data collection method used allows the enumerators to collect data with the tablets and synchronize to the central server at headquarter where data are received, checked for consistency and transmitted to analysts for further analysis using STATA.

2.7. Concepts, definitions and estimation methods

1. Total land area: Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

2. Agricultural area: Agricultural area includes arable land, land under permanent crops and permanent pasture.

3. Arable land: As defined by FAO, arable land includes land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

4. Permanent crop land: Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, Mandaline, Jack fruits, Sugar, apple and Tea.

5. Permanent pastureland: Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

6. Irrigated agricultural land: Area equipped for irrigation, which is actually irrigated, (sometimes expressed as a percentage of the total land area). Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is actually irrigated refers to physical areas. Irrigated land that is cultivated more than once a year is counted only once.

7. Physical area: Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

8. Crop area (cultivated area): Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture. This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot.

In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100 % occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80 % of the total plot area. In that case the area of maize equals 0.8 hectares (1hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60 % and 40 % of total plot area respectively.

The maize area will be 0.6 hectare (1hectare times 0.6), and beans area will be 0.4(1hectare times 0.4). It is important to note that sum of shares of seasonal crops do not exceed one hundred percent.

9. Developed area: Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area.

Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

10. Harvested area: Area harvested is defined as the total number of hectares for all crops that is harvested in a given agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area.

For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava. if the farmer only harvested 1,250 trees. In this case, the farmer has harvested only a quarter (0.125hectares) of the cultivated area.

11. Crop yield: Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

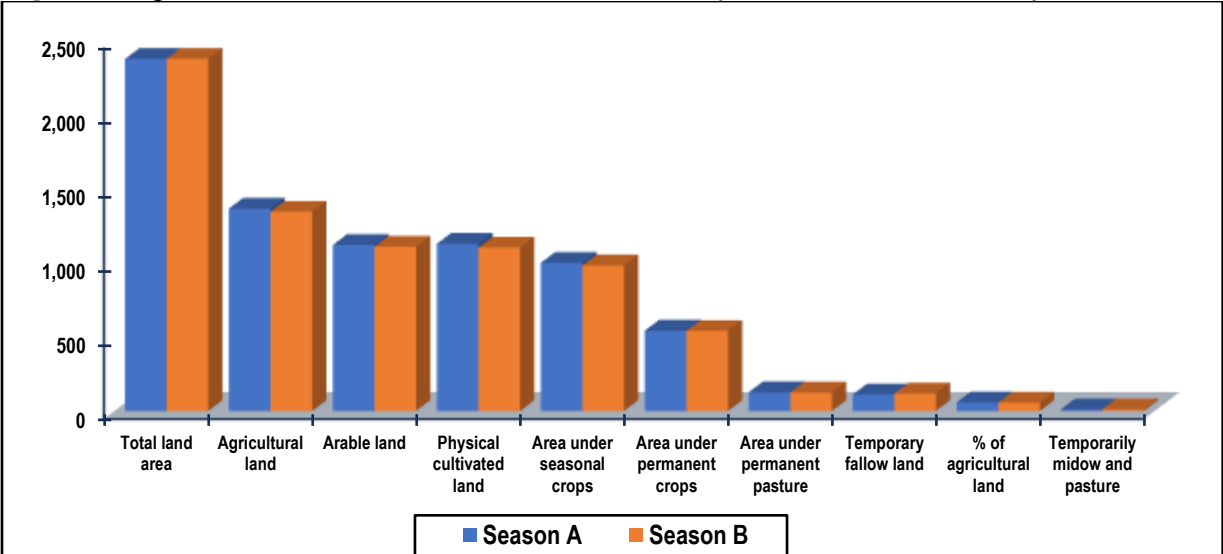

12. Crop production: Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produces times the total harvested area in the district.

III. SURVEY FINDINGS

This section highlights key results of SAS 2023 seasons A, B and C, mainly related to land (physical land use, cultivated area, and harvested area), crop production and yield, agricultural inputs as well as agricultural practices.

3.1. Agricultural land use (,000Ha) for 2023 Season A and B

Figure 2: Agricultural land use for Season A and B 2023 (in thousands of hectares)

Source: NISR, SAS 2023

The total country land area is estimated at 2.377 million of hectares for which 1.367 million hectares (57.5% of total country land) is used for agriculture. For season A, out of the total agricultural land, 1 million hectares were used for seasonal crops, 0.5 million hectares were covered by permanent crops, while 0.126 million hectares were used for permanent pasture. For season B, 1.345 million hectares (56.6% of total country land) is used for agriculture, 0.983 million hectares were used for seasonal crops, 0.540 million hectares were covered by permanent crops.

3.2. Crop area, production and yield for major crops

Maize:

- The cultivated area for maize was estimated at 226,982 hectares in 2023 season A, an increase of 3.3 percent when compared to the same season of 2022. In season B, the cultivated area for maize was estimated at 93,927 hectares, an increase of 15 percent when compared to season B of 2022.
- The production of maize was estimated at 390,879 metric tons in 2023 season A, an increase of 12 percent when compared to season A of 2022. In season B, the production of maize was estimated at 117,613 metric tons an increase of 7.3 percent when compared to season B of 2022.

- The average yield of maize was 1.7 tons per hectare, with an average yield of 1.7 tons and 4.3 tons for small scale farmers and large-scale farmers respectively in season A of 2023. In season B, the national average maize yield was 1.3 tons per hectare, with an average yield of 1.2 tons and 4.1 tons for small scale farmers and large-scale farmers respectively (See Tables 10-24)

Sweet potato:

- The cultivated area for sweet potato was 106,670 hectares in season A of 2023, an increase of 9.1 percent when compared to the same season of 2022. In season B, sweet potato cultivated area was 96,231 hectares, an increase of 5 percent when compared to season B of 2022. In season C, sweet potato cultivated area 4,235 hectares, an decrease of 16.6 percent when compared to the same season of 2022.
- The production of sweet potato was estimated at 667,598 metric tons in season A of 2023, a decrease of 3.8 percent when compared to the same season of 2022. In season B, the production of sweet potato was estimated at 620,185 metric tons, a decrease of 4.5 percent when compared to the same season of 2022. In season C, the production sweet potato was estimated at 24,595 hectares, a decrease of 15 percent when compared to the same season of 2022.
- The average yield of sweet potato was 7.36 tons per hectare in season A of 2023, 7,45 tons per hectare in season B and 5,8 tons per hectare in season C (See district details in table 10-24).

Irish potatoes:

- The cultivated area of Irish potatoes was estimated at 55,613 hectares in season A of 2023, a decrease of 1.5 percent when compared to the same season of 2022. In season B, the cultivated area of Irish potatoes was estimated at 48,210 hectares a decrease of 9.1 percent when compared to the same season of 2022. In season C, the cultivated area under Irish potatoes was 10,540 hectares, an increase of 0.8 percent when compared to the same season of 2022.
- The production of Irish potato was estimated at 454,355 metric tons in season A of 2023, a decrease of 6.5 percent when compared to the same season of 2022. In season B, the production of Irish potato was estimated at 326,677 metric tons, a decrease of 1.3 percent when compared to the same season of 2022. In season C, the production of Irish potato was estimated at 83,981 metric tons, a decrease of 8 percent when compared to the same season in 2022.
- The average yield of Irish potato was 8.2 tons per hectare in season A of 2023, with an average yield of 8.2 and 12.2 tons per hectare for small scale farmers and large-scale farmers respectively. In season B, the average yield of Irish potato was 6,7 tons per hectare, with an average yield of 6,7 and 15,9 tons per hectare for small scale farmers and large-scale farmers respectively. In season C, the average yield for Irish potatoes was estimated at 7,9 tons per hectare. (See district details in table 10-24).

Cassava:

- The cultivated area for cassava was estimated at 239,221 hectares in season A of 2023, an increase of 28.5 percent when compared to the same season of 2022. In season B, the cultivated area for cassava was estimated at 159,089 hectares an increase of 4 percent when compared to season B of 2022.

- The harvested area was estimated at 45,182 hectares in season A of 2023 and 49,655 hectares in season B of 2023.
- The production of cassava was 608,693 metric tons in season A of 2023, a decrease of 4.6 percent when compared to the same season of 2022. In season B, the production of cassava was estimated at 736,686 metric tons, a decrease of 0.1 percent when compared to season B of 2022.
- The average yield of cassava was 13.5 tons per hectare in season A of 2023 and 14,8 tons per hectare in season B of 2023. (See district details in Tables 10-24)

Paddy rice:

- The cultivated area for paddy rice was estimated at 16,135 hectares in season A of 2023, an increase of 1.9 percent when compared to the same season of 2022. In season B, the cultivated area for paddy rice was 16,678 hectares an increase of 1 percent when compared to season B of 2022.
- The production of paddy rice was estimated at 63,688 metric tons in season A of 2023, an decrease of 4.9 percent when compared to the same season of 2022. In season B, the production of paddy rice was estimated at 69,940 metric tons a decrease of 2.7 percent when compared to season B of 2022.
- The average yield of paddy rice was 3,96 tons per hectare, in season A of 2023, with an average yield of 2.3 tons per hectare for small scale farmers and 3,98 tons per hectare large-scale farmers. In season B, the average yield of paddy rice was 4.2 tons per hectare, with an average yield of 2.2 per hectare for small scale farmers and 4.2 tons per hectare for large-scale farmers (See district details in Tables 10-24).

Banana:

- The cultivated area for banana was estimated at 255,290 hectares in season A of 2023, a decrease of 1.6 percent when compared to season A of 2022. In the same season, the harvested area was estimated at 107,411 hectares. In season B, the cultivated area for banana was estimated at 258,094 hectares, an increase of 21 percent when compared to Season B of 2022. In the same season, the harvested area was estimated at 88,361 hectares.
- The production of banana was estimated at 1,219,408 metric tons in season A of 2023, an increase of 2.3 percent when compared to season A of 2022. In season B, the production of banana was estimated at 1,089,377 metric tons, an increase of 7.2 percent when compared to same season fo 2022.
- The average yield of banana was 11.4 tons per hectare in season A and 12,3 tons per hectare in season B (See district details in Tables 10-24).

Beans:

- The cultivate area for beans was estimated at 312,279 hectares in season A of 2023 a decrease of 13.8 percent when compared to season A of 2022. In season B, the cultivated area for beans was estimated at 309,489 hectares, an increase of 15 percent when compared to season B of 2022. In season C, the cultivated area for beans was 3,476 hectares, an increase of 5.6 percent when compared to season C of 2022.

- The production of beans was estimated at 197,212 metric tons in season A of 2023, a decrease of 16.4 percent when compared to season A of 2022. In season B, the production of beans was estimated at 244,194 metric tons, an increase of 16.1 percent when compared to season B of 2022 while in season C, the production of beans was estimated at 3,485 metric tons, an increase of 3 percent when compared to the same season of 2022.
- The average yield of beans was 632 kilograms per hectare in season A, with an average yield of 632 per hectare for small scale farmers and 685 kilograms per hectare large-scale farmers. In season B, the average yield of beans was 789 kilograms per hectare, with an average of 786 kilograms per hectare for small scale farmers and 2,040 kilograms per hectare for large-scale farmers. In season C, the average yield was estimated at 1,003 kilograms per hectare. (see district details in table 10-24).

3.3. Agricultural inputs

This section highlights the use of agricultural inputs. Agricultural inputs include seeds, organic and inorganic fertilizers, and pesticides/fungicides. The survey results are presented in terms of percentage of farmers who applied such agricultural inputs throughout the agricultural year.

3.3.1. Use of seeds

Figure 3: Use of improved seeds (%)

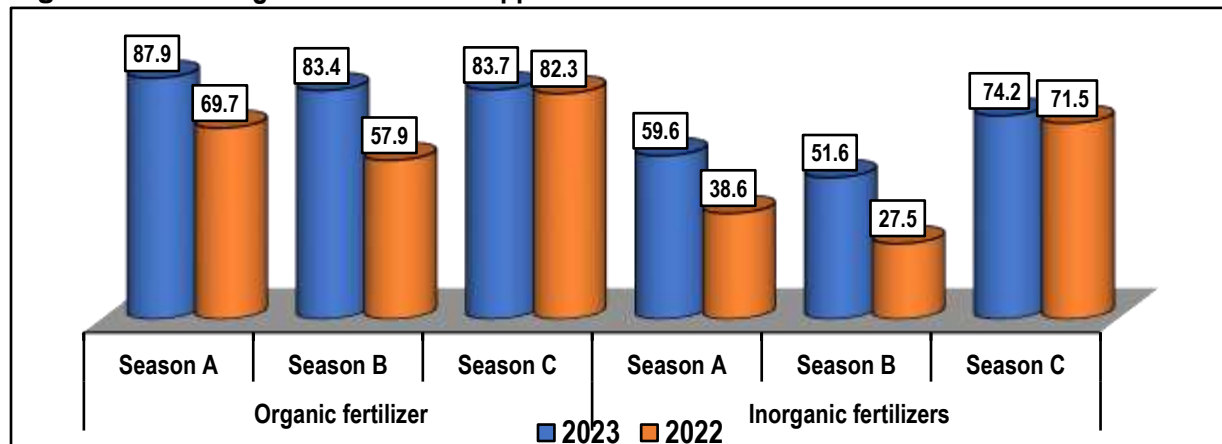

Source: NISR, SAS 2023

Figure 3 shows that 37.1 percent of farmers used improved seeds in season A of 2023 compared to 20.9 percent in season B, and 20.7 percent in season C. In terms of farmer categories, 36 percent of small-scale farmers (SSF) and 85.7 percent of large-scale farmers (LSF) used improved seeds in season A. In season B, 19.6 percent of small-scale farmers and 78.2 percent of large-scale farmers used improved seeds while in season C, 18.1 percent of small-scale farmers and 21.9 percent large-scale farmers used improved seeds.

Agro-dealers and NGOs/companies were the primary sources for improved seeds across seasons of 2023. (See district details in table 31-40).

3.3.2. Use of fertilizers

Figure 4: Percentage of farmers who applied fertilizers.

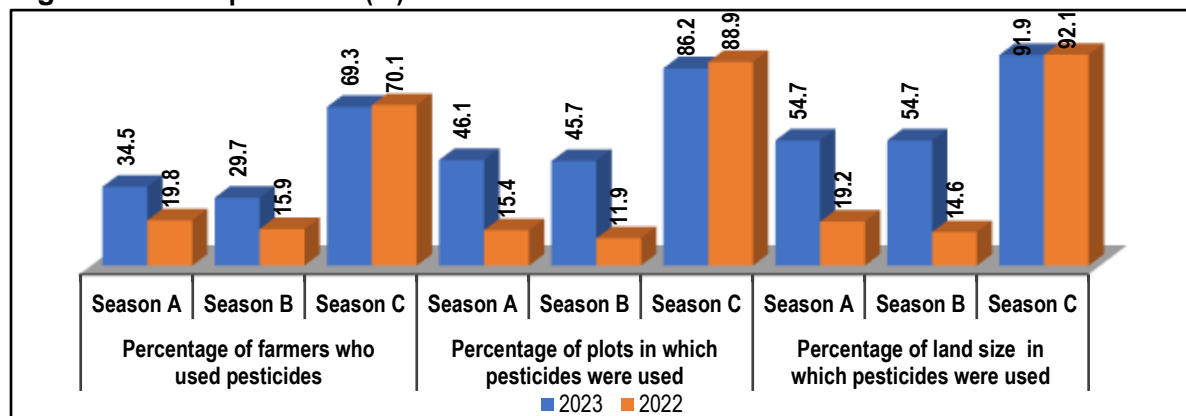

Source: NISR, SAS 2023

In season A of 2023, 87.9 percent of farmers applied organic fertilizers, with 88.2 percent of small-scale farmers and 74.2 percent of large-scale farmers. In season B, 83.4 percent of farmers used organic fertilizers, with 83.7 percent of small-scale farmers and 69.8 percent of large-scale farmers, whereas 83.7 percent of farmers used organic fertilizers in season C.

In regard to inorganic fertilizers, in season A of 2023, 59.6 percent of farmers applied inorganic fertilizers with 59 percent of small-scale farmers and 87.9 percent of large-scale farmers. In season B, 51.6 percent of farmers applied inorganic fertilizers with 50.9 percent of small-scale farmers and 84.2 percent of large-scale farmers in season B, whereas 74.2 percent of farmers used inorganic fertilizers in season C (See district details in table 41-54)

3.3.3. Use of pesticides

Figure 5: Use of pesticides (%)

Source: NISR, SAS 2023

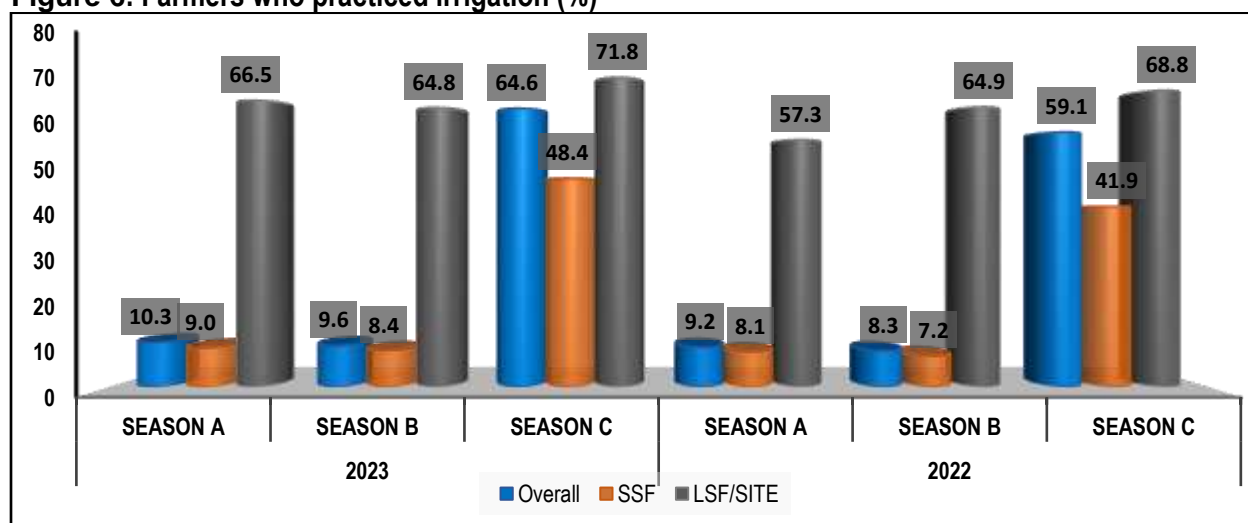

In season A of 2023, 34.5 percent of farmers applied pesticides, with 33.2 percent of small-scale farmers and 86.3 percent of large-scale farmers. In season B, 29.7 percent of farmers applied pesticides with 28.6 percent of small-scale farmers and 79.9 percent of large-scale farmers applied pesticides respectively. Pesticides use was relatively higher in season C, by 69.3 percent of farmers (See details in Tables 55-59).

3.4. Agricultural practices

Agricultural practices assessed include irrigation, mechanisation, erosion control measures and agroforestry adopted by farmers during the SAS 2023. The results are presented in terms of the percentage of farmers who applied such practices.

3.4.1. Irrigation practices

Figure 6: Farmers who practiced irrigation (%)

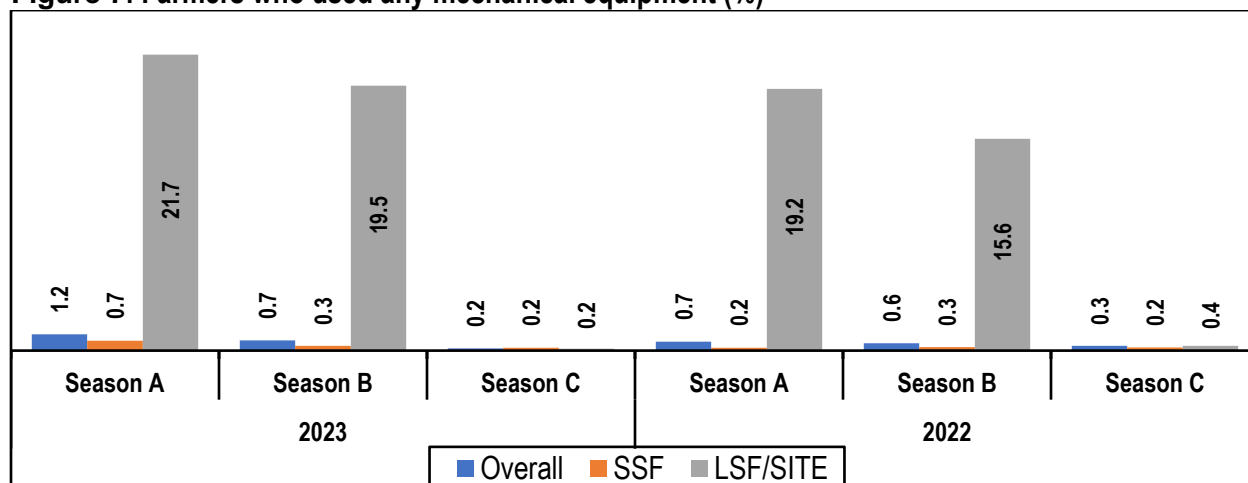

Source: NISR, SAS 2023

In season A of 2023, 10.3 percent of farmers practiced irrigation, compared to 9.6 percent of farmers in season B and 64.6 in season C. During season A, irrigation was practiced by 9 percent of small-scale farmers and 66.5 percent for large-scale farmers, while in season B, irrigation was practiced by 8.4 percent of small-scale farmers and 64.8 percent for large-scale farmers in season B. In terms of irrigation types, 53.6 percent practiced the modern irrigation in season A, 54.3 percent in season B while traditional techniques were predominantly used during season C (75.9%) (See details in Tables 60-73)

3.4.2. Mechanisation

Figure 7: Farmers who used any mechanical equipment (%)

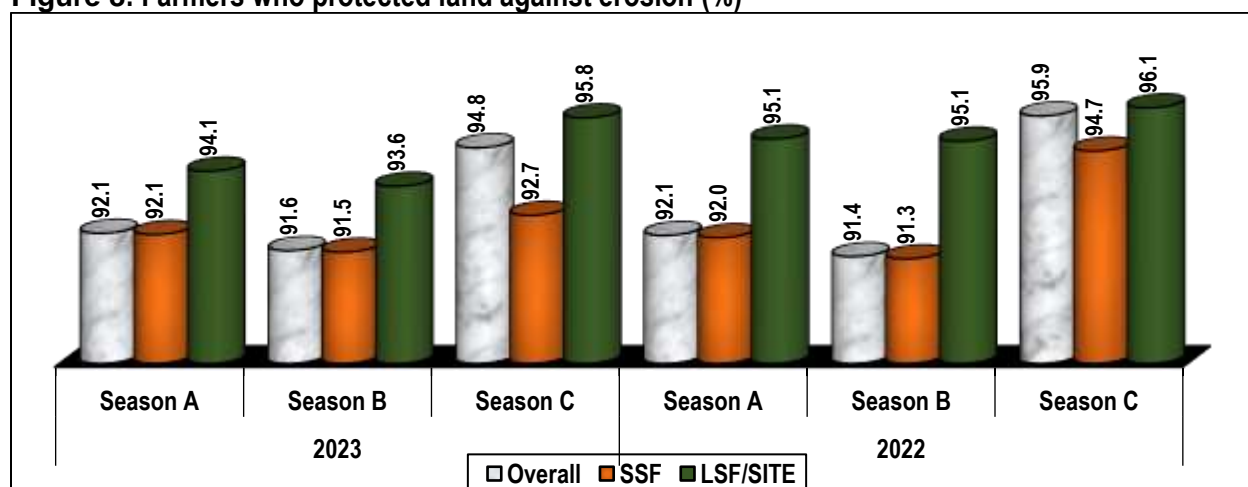

Source: NISR, SAS 2023

In 2023, 1.2 percent of farmers used mechanical equipment for agriculture activities in season A compared to 0.7 percent of farmers in season B and 0.2 in season C. Regarding to farmer types 21.7 percent of large-scale farmers used mechanical equipment for agriculture in season A compared to 19.5 percent of large-scale farmers in season B (See details in Tables 60-73)

3.4.3. Erosion control measures

Figure 8: Farmers who protected land against erosion (%)

Source: NISR, SAS 2023

In the season A of 2023, 92.1 percent of farmers practiced anti-erosion activities compared to 91.6 percent of farmers in season B, and 94.8 percent in season C. Cover plants was the most used type of anti-erosion with 56.7 percent of farmers in season A, 58.9 percent of farmers in B and 38.4 percent in season C (See details in Tables 60-73).

3.5. Gross Value Added (GVA)

The Gross Value-Added value of different crops is shown in constant 2017 prices. Results show the Gross Value Added per hectare for crops such as paddy rice, cassava, irish potato, pea and soya beans, have decreased in 2023 compared to 2022.

Table 5: Main crops GVA in constant 2017 prices (Billion Frw /ha)

Crops	2016	2017	2018	2019	2020	2021	2022	2023
Maize	402,114	309,457	365,527	373,066	389,059	387,754	390,303	407,284

Annex 2: STAFF WHO CONTRIBUTED TO THE SEASONAL AGRICULTURAL SURVEY 2023

National Coordinators

- MURANGWA Yusuf, Director General, NISR
- MURENZI Ivan, Deputy Director General, NISR

Technical coordination

- MWIZERWA Jean Claude, Director of Economic Statistics Department
- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- NIYITEGEKA Beata, GIS Team leader

Field work coordination

- KAMANZI SHINGIRO Jean Philbert, SAS Specialist
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician

Data analysis

- ABAYISENGA Aimable, Agriculture and Environmental Statistician Team Leader
- MUVUNYI Issa, Livestock and fisheries production statistician
- RWAYITARE Jean Bosco, SAS Specialist
- MUREBWAYIRE Divine, SAS Specialist

GIS

- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- IRAMBONA Eddy Marcus, GIS Specialist
- MUNDERERE Theophile, GIS Specialist
- NDAZIGARUYE Alfred, GIS Support Staff
- NGABO MUHIRE Olympe, GIS Support Staff

Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- RWAYITARE Jean Bosco, SAS Specialist

Report writing

- MUTEBUTSI Alexis, SAS Specialist
- RWAYITARE Jean Bosco, SAS Specialist
