FOREWORD

The National Institute of Statistics of Rwanda (NISR) has been conducting the Seasonal Agricultural Survey (SAS) to provide timely and accurate estimates on crop production, cultivated and harvested areas, crop yields, agricultural inputs, and farming practices. These data are crucial for monitoring the progress of agricultural programs and policies in Rwanda. The survey is carried out in close collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI), and the Rwanda Agriculture and Animal Resources Development Board (RAB).

This report highlights the results of the 2025 Seasonal Agricultural Survey covering all the agricultural seasons. It is a vital tool for tracking the progress of national agricultural programs and policies. By providing essential data, the SAS enables policymakers and stakeholders to identify priority areas for intervention and to address critical agricultural challenges effectively.

NISR values the feedback from all users of this report. In this regard, NISR is committed to continuously enhance the diversity of its analyses and the presentation of results to better support the effective use of these findings. NISR acknowledges all individuals who contributed to this exercise.

In particular, NISR expresses its gratitude to the survey coordinators, supervisors, analysts, team leaders, interviewers, drivers for their indispensable dedication and professionalism which were crucial to the successful completion of this survey. NISR also acknowledges the role of respondents who generously gave their time and information. Their contribution has been a cornerstone for the success of the survey.

NISR further encourages all stakeholders, government agencies, researchers, partners, and the general public to use the findings of this report for evidence-based decision-making and to drive the development of Rwanda's agricultural sector.

MURENZI Ivan

Director General, NISR

EXECUTIVE SUMMARY

This is the annual report for the Seasonal Agricultural Survey (SAS) conducted by the National Institute of Statistics of Rwanda (NISR) for the 2024/2025 agricultural year. It covers Rwanda's three agricultural seasons. The main agricultural seasons include Season A, starting from September 2024 to February 2025, Season B starting from March to June 2025, and Season C starting from July to September 2025.

Key findings

A comprehensive summary of the primary indicators assessed during SAS 2025 is presented in Table 0. These indicators include crop production, yield estimates, land use, use of agricultural inputs and agricultural practices.

Land use

In 2025 agricultural year, the country's total land area was estimated at 2.376 million hectares. In season A, 1.399 million hectares (59%) were used for agricultural purposes, of which 1.019 million hectares were used for Seasonal crops, 0.492 million hectares used for permanent crops, and 0.096 million hectares to permanent pasture. In season B, the total land area remained 2.376 million hectares, with 1.423 million hectares (60%) used for agricultural purposes. 1.022 million hectares were allocated to Seasonal crops, 0.524 million hectares for crops, and 0.1 million hectares were allocated to permanent pasture.

Use of inputs

Agricultural inputs include improved seeds, organic and chemical fertilizers, as well as pesticides and fungicides. In 2025, 37.3 % of farmers used improved seeds during season A, compared to 18% in season B, and 18.9% in season C. The organic fertilizers was used by 88% of farmers in season A, compared to 80.8% in season B, and 83.5 % in season C. In contrast, the inorganic fertilizers was used by 63.2% of farmers in season A, compared to 55.5% in season B, and 65.8 % in season C. Pesticides and fungicides was used by 41.9% of farmers in season A, compared to 36.6% in season B, and 67 % in season C.

Agricultural practices

In season A of 2025, 13.4% of farmers practiced irrigation compared to 11.5% of farmers in season B and 58.9% in season C. In 2025 Season A, 90.3% of farmers practiced anti-erosion activities, compared to 89.9% of farmers in season B and 94.7% of farmers in season C.

I

INTRODUCTION

Agriculture continues to be one of the most important pillars of economic growth in Rwanda, with its transformation receiving significant emphasis under the new National Strategy for Transformation (NST2). Recognizing its potential for economic development, food security and poverty reduction, the Government has established an ambitious agricultural agenda under the new strategy for transformation of agriculture (PSTA 5) aiming at transformation of Rwandan agriculture from a sector characterised by low productivity to a sector using knowledge to increase productivity and investing in value addition and commercialization.

High-quality agricultural statistics plays a vital role in assessing the performance of national agricultural programs and are, therefore, essential for evidence-based decision making. While the use of statistics in decision-making processes continues to grow, the demand for agriculture data is also increasing. To meet this demand, the National Institute of Statistics of Rwanda (NISR), in collaboration with the Ministry of Agriculture and Animal Resources (MINAGRI), conducts the Seasonal Agricultural Survey (SAS). This survey systematically gathers information on potential agricultural land use, crop area, yield, production, agricultural inputs, agricultural practices and other relevant agricultural statistics.

The survey data are complemented by administrative records from the National Agricultural Export Development Board (NAEB), collected through its routine monitoring of coffee and tea production. The Seasonal Agricultural Survey (SAS) is conducted by NISR across Rwanda's three main agricultural seasons: Season A (September to February of the following year), Season B (March to June) and the shorter Season C (July to September). Season C is mainly for vegetables and sweet potato grown in swamps and Irish potato grown in the volcanic agro-ecological zone.

Every three years, SAS undergoes an upgrade to revise the sample frame based on changes in land classes and subsequently select new sample segments to be surveyed over the subsequent three-years. This report outlines the third upgrade of the Seasonal Agriculture Survey, detailing the enhancements made to the area frame, data collection activities, and key findings from the three Seasons.

1.1. Objectives of the Seasonal Agricultural Survey (SAS)

The primary objective of SAS is to provide timely, accurate, reliable, and comprehensive agricultural statistics that describe the structure of agriculture in Rwanda. This is mainly achieved through the measurement of land use, crop area, yield, and crop production. The survey results are useful for monitoring current agricultural and food supply conditions, thereby facilitating evidence-based decision making for the development of the agricultural sector.

The survey specifically captures data related to land use: including agricultural land, arable land, physical crop cultivated area, crop land, pastureland, and fallow land. It also gathers information on crop production, measuring the quantity of harvested crop in kilograms or tons. The survey further quantifies crop yield, indicating the harvested crop per unit of land area in kilograms per hectare. Moreover, it examines the use of agricultural inputs such as improved seeds, fertilizers, and pesticides. Finally, the survey explores various agricultural practices, including irrigation, soil erosion protection, agroforestry, and agriculture mechanization.

2.1. Sample frame design

To provide the basis for conducting probability-based surveys that comprehensively capture farm-level data and to enhance the precision of survey estimates, the Seasonal Agricultural Survey employs a Multiple Frame Sampling (MFS) methodology. This approach involves constructing an area frame from which the survey sample is selected. In addition, a list frame of Large-Scale Farmers (LSF), defined as those operating at least 10 hectares of agricultural land is done to complement the area frame. This ensures comprehensive coverage of crops predominantly cultivated by large-scale farmers, which might not be adequately represented using an area frame alone. The construction of the area frame involves several steps, including land cover classification, land stratification and the sampling of segments.

2.1.1. Land cover classification

Land classification serves as the first step in designing the sampling frame for the Seasonal Agriculture Survey. This process involves categorizing the total available land in the country into distinct land use or land cover types. The primary purpose is to enhance sampling precision by ensuring the appropriate targeting of the adequate land. This classification was achieved through a combination of available national different spatial layers with the photo-interpretation of a time series of high-resolution (50 to 30 cm) satellite images spanning from 2010 to 2023. As a result, the country's total land was divided into 14 distinct land cover classes (as shown in Table 1).

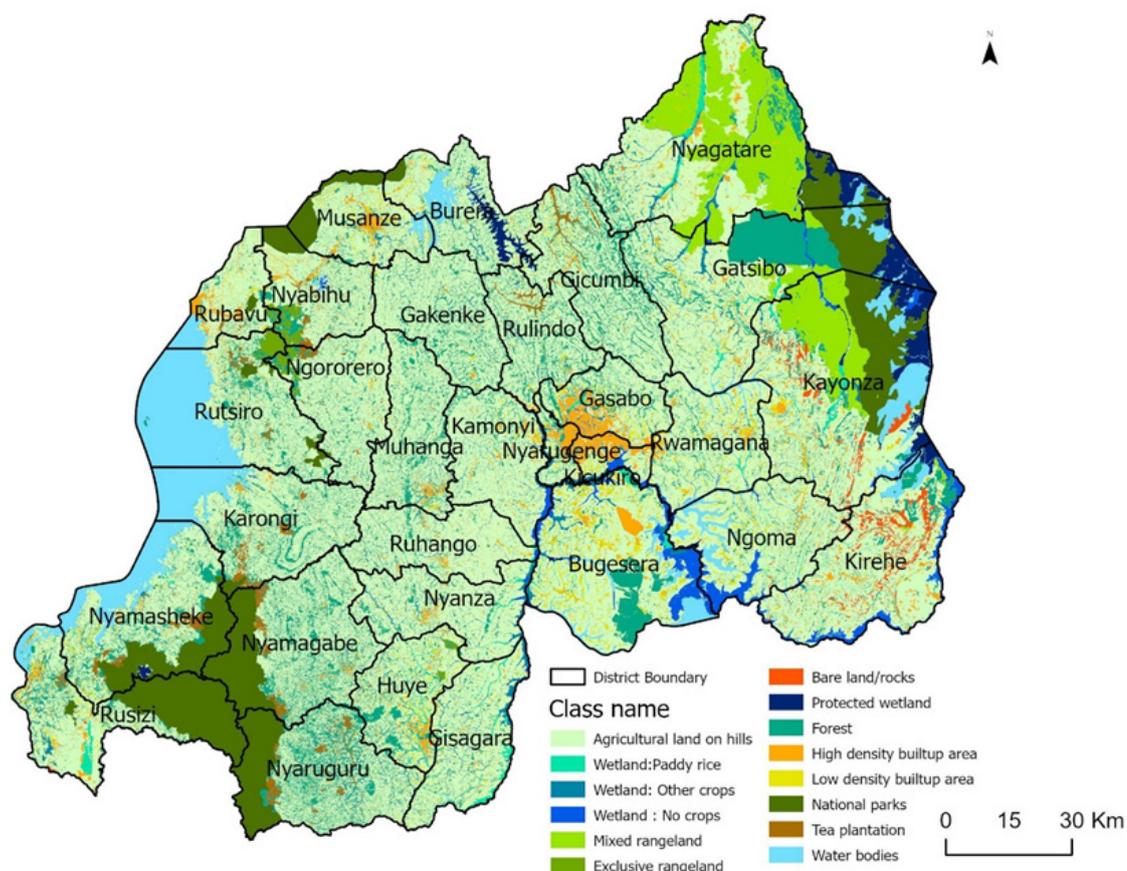

Table 1: List of Rwanda land cover classes

No	Class name	Area (Ha)	Percentage share
1	Agricultural land on hills	1,307,956	51.7
2	Non-rice Agricultural Wetland	56,905	2.2
3	Mixed rangeland	127,640	5.0
4	Low-density built-up area	95,740	3.8
5	Paddy rice wetland	22,825	0.9
6	Tea plantation	23,732	0.9
7	Non cropped wetlands	36,846	1.5
8	Forest	381,391	15.1
9	National parks	190,247	7.5
10	Water bodies	155,030	6.1
11	High-density built-up area	58,657	2.3
12	Protected wetland	45,883	1.8
13	Bare land/rocks	15,412	0.6
14	Exclusive rangeland	13,064	0.5

Source: NISR, SAS 2025

Among 14 land cover classes, only 6 are related to agricultural activities include agricultural land on hillside, non-rice agricultural Wetland, mixed rangeland, low-density built-up area, wetlands designated for paddy rice and tea plantation.

Map 1: Rwanda land classification map

Source: NISR, SAS 2025

The subsequent step involves constructing the area frame which includes grouping the land cover classes linked to agricultural activities into strata to identify agricultural strata to be considered in the sampling frame

2.1.2. Land stratification.

The stratification is a result of a combination of sampling units (clusters) and land use/land cover. The stratification assigns each cluster a stratum based on the predominant land class type. Among the fourteen land cover classes, four are included in the agricultural survey frame, while the others are excluded.

The included land cover classes comprise hillside agricultural land, non-rice agricultural land, mixed rangeland, and low-density built-up areas (which retain potential for agricultural production, such as kitchen gardens, fruit trees, and livestock). However, specific agricultural land classes are excluded from the sampling frame. For example, tea plantations are omitted due to regular monitoring by the National Agricultural Export Development Board (NAEB). Similarly, wetlands designated for paddy rice cultivation are typically considered under the Large-Scale Farmers component, thereby integrating them into the survey frame. Moreover, beginning in 2024, a new land cover class called “Exclusive Rangeland” has been introduced specifically to identify areas used for pastoral activities. This class is also excluded from the sampling frame.

By overlapping the clusters layer with land cover classes layer, each cluster is assigned a dominant land cover class as a stratum definition, basing on a defined threshold as follow:

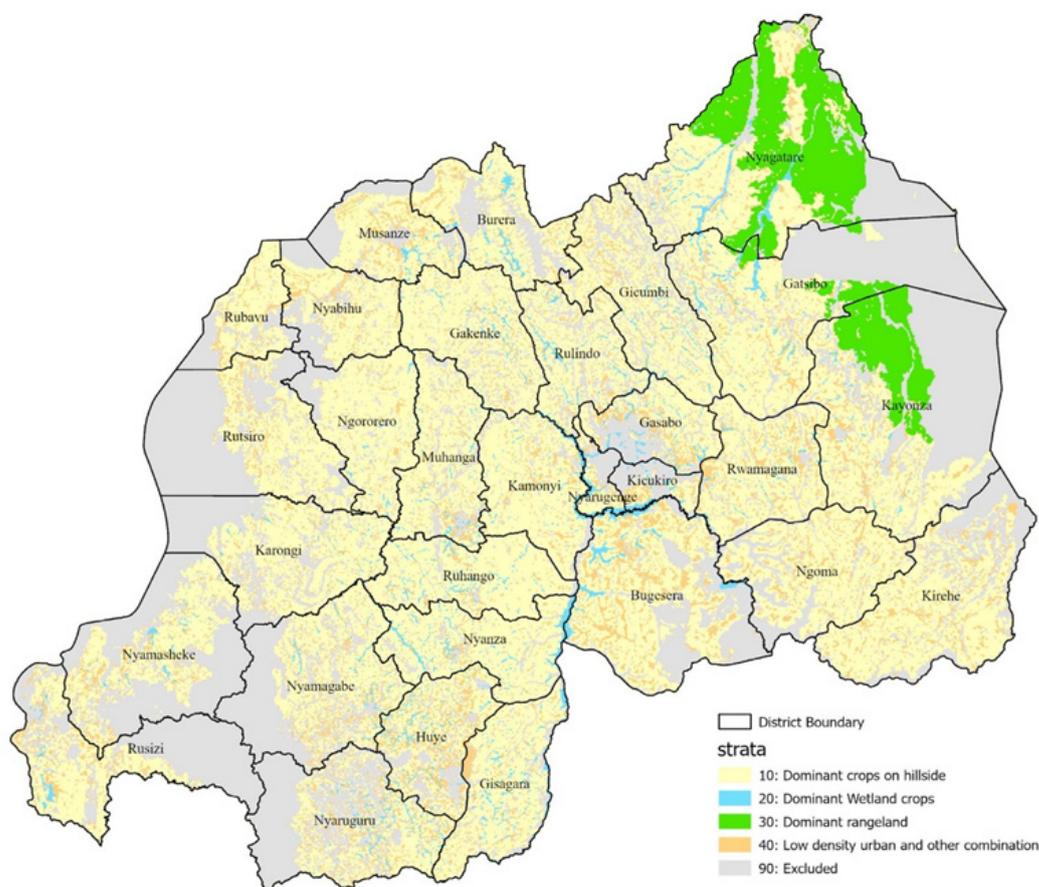

Table 2: List of strata

Stratum code	Stratum name	Definition
1.0	Dominant hill crop land	Clusters with Hillside agricultural land cover class greater or equal to 60% of the total area of the cluster
2.0	Dominant Wetland crops	Clusters with non-rice wetland land cover class greater than 25% of total area of the cluster
3.0	Dominant rangeland	Clusters with mixed rangeland land cover class greater or equal to 60% of the total area of the cluster
4.0	Mixed	The rest of other possible combinations
9.0	Excluded	All clusters with excluded land cover classes greater or equal to 50% of the total area of the cluster

Source: NISR, SAS 2025

The SAS sample is drawn from four main strata: Dominant hill crop land, dominant wetland crops, dominant rangeland, and mixed land strata

Map 2: Distribution of stratified clusters by district

2.1.3. Sampling Units

The Seasonal Agricultural Survey is an area-based sample survey that uses land sampling units, small square land units of 300 by 300 meters (9ha). Geographic Information System (GIS) technology is used to create the units covering the whole country. In total the sampling frame comprises 269,989 square units (clusters) for season A and B and 144,915 square units (clusters) for season C. Each cluster is assigned a unique cluster number as shown on the map below.

2.1.4. Sampling procedures

Among the five defined strata, only four are considered to have agricultural land potential: the dominant hill crop land stratum, dominant wetland crops stratum, dominant rangeland stratum and mixed stratum. The remaining stratum is classified as non-agricultural land. It is important to note that clusters covered by tea plantations and wetlands designated for paddy rice cultivation are excluded from the area sample frame for the reasons stated previously. Thus, SAS is conducted within the four above mentioned strata. At the first sampling stage, a total of 1200 segments are selected and allocated at the district level based on the power allocation approach (Bankier, 1988¹). Within each district, sampled segments are then distributed among strata using a proportional-to-area criterion. Specifically, for Season C, a shorter agricultural season that does not encompass the entire agriculturally potential land, the sample was selected exclusively from three sub-strata: The Dominant Wetland, Season A and B frames within the volcanic agro-ecological zone (characterized by consistent rainfall), and special sites with established irrigation infrastructure. For Season C, 946 segments were selected and allocated at the district level.

¹ Bankier M.D. (1988) Power allocations: determining sample sizes for subnational areas. *The American Statistician*, Vol. 42, n. 3 pp. 174-177.

Table 4: Allocation of sampled segments per district by stratum

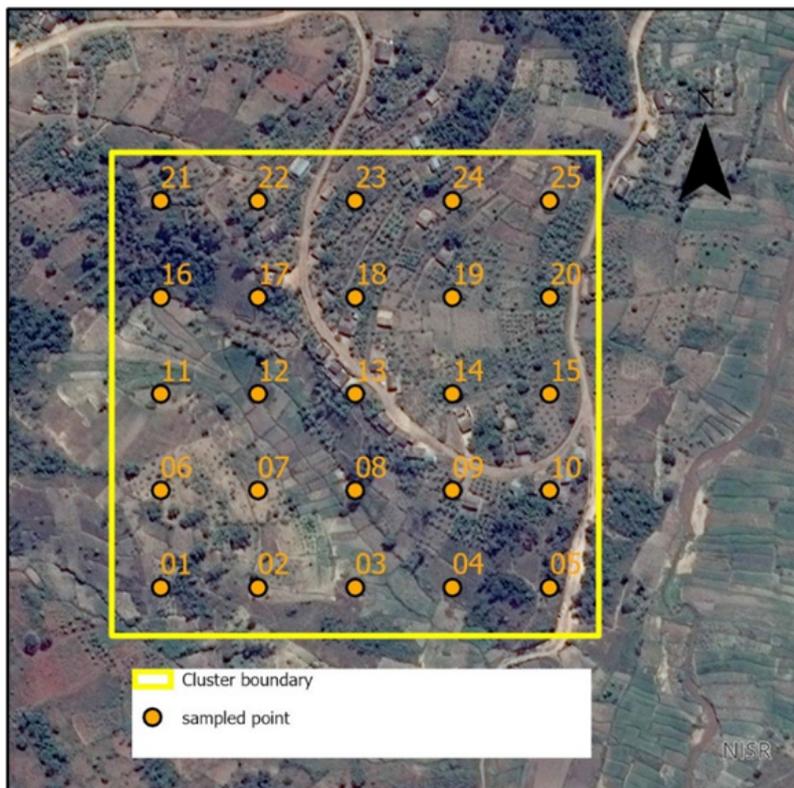

District	Stratum				Total A & B	Season C

Total	948	75	43	134	1,200	946

Source: NISR, SAS 2025

At the second stage, 25 sample points are systematically selected, following a special distance of 60 meters between points. Sample points serve as reporting units within each segment. Enumerators visit each point, identify and delineate the plots in which the sample point falls, and collect records of land use and related information.

The recorded information represents the characteristics of the whole segment which are extrapolated to the stratum level and hence the combination of strata within each district provides district area related statistics.

Map 4: Map showing square cluster(segment) with 25 sampled points

Source: NISR, SAS 2025

2.1.5. Weighting Procedures

Based on the stratified two-stage sample design used with the new area frame, the first stage sampling probability for the sample segments in each stratum is calculated as:

$$p_{1h} = \frac{n_h}{N_h}$$

Where:

p_{1h} = probability of selection of sample segments in stratum h (district by stratum)

n_h = number of sample segments selected in stratum h

N_h = total number of segments in the area frame for stratum h in each stratum

The second stage probability was calculated at the plot level based on the assumption that the plots within each sample segment were implicitly selected with PPS using the area of the plot as the measure of size. Therefore, the second stage probability of selection can be expressed as follows:

$$p_{2hi} = \frac{g_{hi} \times A_{hij}}{A_{hi} \times g_{hij}}$$

Where:

- p_{2hi} = Probability of selection of the plot in segment h
- g_{hi} = Number of grid squares selected in the i-th sample segment of stratum h;
- A_{hij} = Area of the j-th sample plot selected in the i-th sample segment of stratum h
- A_{hi} = Area of the i-th sample segment of stratum h;
- g_{hij} = Number of selected grid squares in the j-th sample plot of the i-th sample segment of stratum h

The weight of a sample plot is equal to the inverse of the first and second stage probabilities of selection:

$$W_{Phij} = \frac{1}{p_{1h} \times p_{2hi}} = \frac{N_h \times A_{hi} \times g_{hij}}{n_h \times g_{hi} \times A_{hij}}$$

Where:

- W_{Phij} = weight for the j-th sample plot in the i-th sample segment in stratum h

2.1.6. Sampling errors computation

Survey results are subject to two primary types of error: (i) sampling errors and (ii) non-sampling errors. Non-sampling errors encompass all sources of errors unrelated to sampling, occurring throughout all aspects of the survey process, including data collection and processing. These are typically categorized into four types: coverage errors, measurement errors, non-response errors, and processing errors. While researchers take steps to minimize such errors through the survey design and implementation phases, it is practically impossible to eliminate them entirely. Non-sampling errors, in particular, pose significant challenges for accurate identification and quantification. Despite all precautions, there's always some degree of uncertainty associated with survey results due to the presence of these errors.

Sampling errors are associated with the sampling selection process, arising from observing a sample instead of the entire population. They denote the disparity between the estimate derived from a sample survey and the true value that would result if a census of the whole population were conducted under the same conditions.

In order to assess the precision of important estimates from the 2025 SAS data and the statistical efficiency of the agricultural area frame and sample design, it is important to calculate the sampling errors and corresponding coefficients of variation (CVs) for these estimates, such as the total area in each major crop. The sampling error for an estimate is measured by its standard error, defined as the square root of its variance. The Complex Samples module in SPSS and Stata employ a linearized Taylor series variance estimator, which considers the stratification and clustering in the sample design.

The SPSS Complex Samples software were used to calculate the sampling errors and CVs for estimates of the total area of major crops from the SAS data.

The formula for the estimate of a total can be expressed as follows:

$$\hat{Y} = \sum_{h=1}^L \sum_{i=1}^{n_h} \sum_{j=1}^{m_{hi}} W'_{hi} y_{hij} ,$$

Where:

L = number of strata

y_{hij} = value of variable y for the j -th sample household in the i -th sample segment in stratum h

The variance estimator for a total used by the Complex Samples module of SPSS and Stata can be expressed as follows:

Variance Estimator for a Total:

$$V(\hat{Y}) = \sum_{h=1}^L \left[\frac{n_h}{n_h - 1} \times \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right]$$

Where:

$$\hat{Y}_{hi} = \sum_{j=1}^{m_{hi}} W'_{hi} y_{hij}$$

y_{hij} : value of variable for the j -th sample plot in the i -th sample segment of stratum h

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

The survey estimate of a ratio is defined as follows:

$$\hat{R} = \frac{\hat{Y}}{\hat{X}}$$

Where \hat{Y} and \hat{X} are estimates of totals for variables Y and X , respectively, calculated as specified previously.

In the case of a stratified two-stage sample design, means and proportions are special types of ratios. In the case of the mean, the variable X , in the denominator of the ratio, is defined to equal 1 for each unit so that the denominator is the sum of the weights. For a proportion, the variable X in the denominator is also defined to equal 1 for all units; the variable Y in the numerator is binomial and is defined to equal either 0 or 1, depending on the absence or presence, respectively, of a specified characteristic for the unit.

The variance estimator for a ratio used by SPSS Complex Samples and Stata can be expressed as follows:

Variance Estimator for a Total:

$$V(\hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right)^2 \right]$$

Where:

f_h : first stage probability for stratum ;

$(1 - f_h)$: is the finite population correction (fpc) factor.

$$\hat{Y}_{hi} = \sum_{j=1}^{m_h} W'_{hi} y_{hij}$$

y_{hij} : value of variable for the i -th sample plot in the j -th sample segment of stratum

$$\hat{Y}_h = \sum_{i=1}^{n_h} \hat{Y}_{hi}$$

Variance Estimator for a Ratio:

$$V(\hat{R}) = \frac{1}{\hat{X}^2} [V(\hat{Y}) + \hat{R}^2 V(\hat{X}) - 2\hat{R} COV(\hat{X}, \hat{Y})]$$

Where:

$$COV(\hat{X}, \hat{Y}) = \sum_{h=1}^L \left[(1 - f_h) \times \frac{n_h}{n_h - 1} \sum_{i=1}^{n_h} \left(\hat{X}_{hi} - \frac{\hat{X}_h}{n_h} \right) \left(\hat{Y}_{hi} - \frac{\hat{Y}_h}{n_h} \right) \right]$$

$V(\hat{Y})$ and $V(\hat{X})$ are calculated using the formula for the variance of a total.

In addition to calculating standard error, the program further computes the Design Effect (DEFF) for the main indicator, the area under cultivation. The Design Effect is defined as the variance of an estimate derived from the actual complex sample design, divided by the corresponding variance that would be expected from a simple random sample of identical size. It serves as a measure of the sample design's relative statistical efficiency, incorporating both the stratification and clustering present in the sample design.

Clustering typically increases the design effect due to the intra-cluster correlation among plots within the same segment. Simultaneously, land-use stratification of segments typically, decreases the design effect, as it a more efficient sampling strategy than simple random sampling. Accounting for both factors provide a comprehensive assessment of how effectively the sample design captures the variability of the area under cultivation. Estimates of the total area for major crops at the national level, along with corresponding precision measures (standard error (SE), the coefficient of variation (CV), the 95 percent confidence interval, the design effect (DEFF), and number of unweighted observation (n of sample plots)) from the SAS 2025 data are presented in Tables 5, 6 and 7.

Table 5: 2025 Season A Sampling Errors for major crops at the national level

Crop name	Estimate	SE	CV	95% Confidence Interval		DEFF	No. observations (plots)
				Lower	Upper		
Maize	244,095	6,391	0.026	231,555	256,635	0.159	8,368

2.2. Data collection procedures

Data collection for the Seasonal Agricultural Survey (SAS) is carried out in two distinct phases. The first phase, referred to as the screening phase, occurs during the planting period. It consists of delineating all plots that contain the sampled points within the sampled segments, as well as identifying all Large-Scale Farmers (LSF) who have grown crops in the current season. This phase records information related to agricultural land use, grown crops and crop area, and the expected harvesting period. The second phase involves collecting data from the agricultural plots identified during the screening activity. This data relates to crop production, the utilization of agricultural inputs, and the agricultural practices.

2.2.1. Time frame and coverage

In 2025 the Seasonal Agricultural Survey (SAS) was conducted across all 30 districts of Rwanda. The data collection covered 1,200 segments and 382 large-scale farmers in season A, from December 1st, 2024, to February 15th, 2025, and 1,200 segments and 379 large-scale farmers in season B from April 21st to June 30th, 2025. In addition, the data collection for Season C took place from 1st to 30th September, 2025, covering 946 segments identified as suitable for growing Season C crops. The survey response rate was 100%. This included full participation from operators of the sampled plots and all large-scale farmers across all seasons.

2.2.2. Field staff

During the 2025 agricultural year, a team of 148 enumerators and 29 team leaders conducted the field data collection following a comprehensive refresher training. To ensure data quality, high-level supervision was conducted throughout all data collection phases across the three agricultural seasons.

2.2.3. Data collection tools

2.2.3.1. Survey questionnaires

SAS uses two main questionnaires: The Screening questionnaire and the Plot interview questionnaire. The Screening Questionnaire is designed to gather information on the plot, focusing primarily on aspects such as land use, plot area, and the crops grown. On the other hand, the Plot Interview questionnaire is specifically designed to collect detailed information about the sampled plots, including crop production, agricultural inputs used, and agricultural practices applied.

2.2.3.2. Data collection applications

The SAS data collection applications were based on three main software applications:

- ⇒ Arc GIS field map, which utilizes GIS software and external GPS linked to tablets via Bluetooth to accurately measure crop areas.
- ⇒ CSPro software, known for its efficiency in census and survey administration, facilitating data collection, entry, and management processes. Csentry data collection tool has been developed by an IT staff specialized for the SAS survey, enabling data collection from sampled plots and large-scale farmers.
- ⇒ Survey123 is used to collect screening data for large-scale farmers.

2.3. Data quality assurance

Data quality assurance is achieved through a comprehensive approach, involving enumerator training, continuous data monitoring, supervision of data collection activities, and data editing throughout the season.

2.3.1. Training of enumerators

Prior to data collection, enumerators underwent training at the start of each season. The training for Season A took place from 4th to 22nd November 2024, for Season B from 15th to 19th April 2025, and for Season C from 25th to 29th August, 2025. All training sessions were conducted at the NISR Training Center. The sessions covered the overview of the SAS, data collection procedures and ethics, screening procedures, plot interview questionnaire content, and the use of data collection applications such as Survey 123, Arc GIS field map, and CSEntry.

2.3.2. Fieldwork monitoring

2.3.2.1. Monitoring attendance and performance of enumerators

Effective monitoring of enumerator attendance and performance is vital for ensuring operational efficiency and contribution. The monitoring system employed for the 2025 SAS relies on captured GPS metadata, including location and GPS time which differs from the device time and cannot be modified by the user. Whenever an enumerator submits data to the server, the metadata is transmitted concurrently. This enables the analysis of attendance (starting and ending time), location during data collection, and performance metrics such as the number of completed tasks.

2.3.2.2. Attending the sample location and Use of high precision GPS

The Seasonal Agricultural Season (SAS) collects data from observation points grouped into square segments of 300 by 300 meters. Enumerators are required to collect data within a one-meter distance buffer around each observation point, a protocol enforced to ensure measurement accuracy. Any observation recorded outside this buffer is marked as errors and automatically rejected by the central database. To measure plot areas, high-precision GPS units are employed, along with correction services, achieving 95% sub-meter measurement accuracy and addressing precision challenges.

2.3.2.3. Field Monitoring Dashboard

A field monitoring dashboard used is an online web application offering a visual representation of real-time data collected from various field operations. It provides a centralized and accessible platform for monitoring and managing activities, resources, and performance in the field.

2.3.2.4. Field supervision

To ensure data quality throughout 2025 survey seasons, an intensive field supervision was implemented. During Season A, the first field supervision was conducted from December 15th to 24th, 2024, and a subsequent field supervision during the harvesting phase, from January 19th to February 2nd, 2025 by a team of NISR staff.

In Season B, the first supervision was conducted from April 27th to May 11th, 2025 and during the harvesting phase from June 8th to 22nd, 2025. In Season C, a field supervision was conducted from September 14th to 28th, 2025 by NISR staff.

Throughout all supervision phases, NISR staff were deployed to all districts to provide continuous oversight, offering technical guidance, monitoring activity implementation, ensuring ethical adherence, verifying data completeness, and resolving field challenges.

2.3.2.5. Data Editing

During the SAS 2025, a monitoring system involving the GIS tools and data editors was used to ensure quality assurance. The data collection is monitored using dashboard and Google Sheets. Editors conduct daily follow-ups to clean data, identifying and rectifying discrepancies using STATA do files based on logical patterns and feedback from training sessions, aiming to provide a cleaned raw dataset for further analysis.

2.4. Data processing and analysis process

The analysis involved several steps from organization of raw dataset, data management, cleaning, checking for outliers and dealing with missing data to ensure the quality and cleaned dataset before tabulation.

2.4.1. Data management process

Data for SAS are collected electronically using tablets and transmitted directly to NISR servers. Following collection, the data analytics team downloads and imports the data from CPro into STATA software for further examination, including checking, cleaning, and tabulation.

An exploratory analysis of the dataset is conducted for all variables to assess the sample completeness, identifying missing data or incomplete observations. Any identified cases are sent back to the field for verification and completion. This analysis employs exploratory techniques such as descriptive statistics (summary statistics, frequency tables) and graphical methods (histograms, box plots, etc.) are employed to detect missing values, incomplete data, and potential abnormalities or outliers within the dataset.

2.4.2. Detecting outliers and dealing with missing values

2.4.2.1. Missing values and duplicates observation

During data collection, the CPro application enforces validation rules to detect missing, omitted, or skipped variables. When enumerators skip mandatory questions, real time error messages appear on the tablet screen during the interview. Furthermore, before final submission, the system performs a final validation check. An error message notifies the user if any required questions have been left unanswered or if duplicate questionnaire IDs are identified.

After the data is downloaded from the server and imported into STATA, the analysis begins with preparatory phase. The data analyst merges the area and crop dataset, followed by preliminary data checks, cleaning procedures, and any necessary transformations. For this purpose, a do-file is developed to assess the completeness of data for both screening and plot/harvest datasets.

A dedicated team of data analysts checks the data on a daily basis, and any inconsistencies identified are communicated to the field team for correction and clarification.

2.4.2.2. Detecting and dealing with outliers

All quantitative variables, including crop production, fertilizer quantity, seed quantity, agricultural input prices, irrigation costs, and related expenses are subjected to outlier detection. For variables such as crop production and input quantities, two approaches are employed to detect outliers, while a single approach is applicable for the remaining variables.

The first approach involves comparing the value per hectare of land to the standard quantity optimum provided in the guidelines from the Ministry of Agriculture, known as “AGENDA AGRICOLE,” for the corresponding land size. Any reported value found to be 1.5 times greater than the standard values is flagged as a potential outlier and is subsequently returned to field workers for verification and confirmation.

The second approach utilizes statistical processes to detect outliers. Within SAS, a combination of statistical methods, including analysis based on standard deviation and graphical methods such as normal box plots, are utilized to identify possible outliers in the dataset.

2.4.3. Methods for Estimating Area and Yield

2.4.3.1. Estimation of area Approach

The National Institute of Statistics of Rwanda (NISR) adheres to methodologies and guidelines for area and yield estimation as outlined by (FAO, 2017) and (EAC, 2022). Among the proposed methods, NISR employs high-precision GPS technology to measure crop area due to its high accuracy and efficiency compared to alternative methods. For yield measurement, NISR relies on farmer estimations.

2.4.3.2. Process of measuring the area

After the identification of the plot boundaries, the enumerators mark GPS points location in approximately every three meters and at each corner of the plot while moving around its perimeter. Then a polygon is obtained when the starting and final points connect. The area is finally computed automatically by GIS software linked to the enumerator’s GPS and based on the resulting shape.

2.4.3.3. Process of measuring the yield

Yield data are calculated by considering both the plot and crop areas, alongside the crop production reported by the farmer within the sampled plot. This calculation involves dividing the total production, converted into kilograms, by the estimated crop areas measured in hectares.

2.4.4. Data Analysis

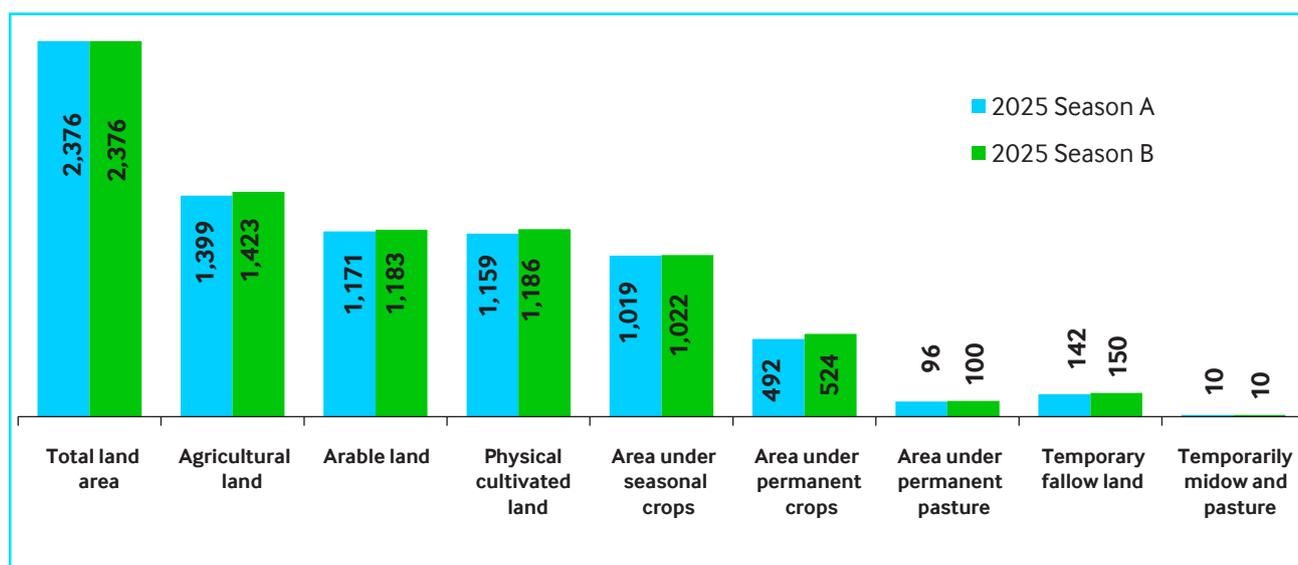

The survey data are analysed using STATA software, which offers robust capabilities for data management, including importing, cleaning, merging, and manipulating datasets. These features facilitate data preparation for analysis. Additionally, STATA enables the development of tabulation commands and the generation of survey tables, graphs, and charts for inclusion in survey reports. Furthermore, SPSS and STATA softwares are utilized for estimating survey sampling errors, ensuring the accuracy and reliability of the survey results.

SURVEY FINDINGS

This section highlights key results of SAS 2025 related to crop area (physical land use, cultivated area, and harvested area), yield, production, agricultural inputs, and agricultural practices in Rwanda.

3.1. Agricultural land use (,000Ha) for 2025 Season A and B

Figure 1: Agricultural land use for Season A and B 2025 (in thousands of hectares)

Source: NISR, SAS 2025

The total national land area was estimated at 2.376 million hectares. For Season A of 2025 agricultural year, 1.399 million hectares (59%) were used for agriculture. Of this, 1.019 million hectares are planted with seasonal crops, 0.492 million hectares under permanent crops, and 0.096 million hectares dedicated to permanent pasture. In Season B, 1.423 million hectares (60%) was used for agriculture. This was distributed as 1.022 million hectares for seasonal crops, 0.524 million hectares for permanent crops, and 0.1 million hectares for permanent pasture.

3.2. Crop area, production and yield for major crops

3.2.1 Yield and Crop area for major crops

Maize:

In Season A 2025, the cultivated area for maize in Season was estimated at 244,095 hectares, a decrease of 2% from season A of 2024. The national average yield was 2 tons per hectare, with an average yield of 1.9 tons and 4.1 tons for small scale farmers and large-scale farmers respectively

In season B 2025, the cultivated area for maize was estimated at 93,005 hectares, an increase of 0.1 % from season B of 2024. the national average maize yield was 1.3 tons per hectare, with an average yield of 1.2 tons and 4.2 tons for small scale farmers and large-scale farmers respectively. (See Tables 13-26)

Beans:

In Season A 2025 the cultivated area for beans was estimated at 327,147 hectares, a decrease of 0.6% from season A of 2024. The average beans yield was 705 kilograms per hectare in season A, with an average yield of 704 per hectare for small scale farmers and 830 kilograms per hectare large-scale farmers.

In season B, the cultivated area for beans was estimated at 335,052 hectares, an increase of 1.8% from season B of 2024. the average yield of beans was 719 kilograms per hectare, with an average of 716 kilograms per hectare for small scale farmers and 1,265 kilograms per hectare for large-scale farmers.

In season C of 2025, the cultivated area for beans was 3,136 hectares, an increase of 8% compared to season C of 2024. The average yield was estimated at 1,013 kilograms per hectare. (see district details in Tables 13-26).

Paddy rice:

In season A of 2025, the cultivated area for paddy rice was estimated at 17,312 hectares, an increase of 0.8 % from season A of 2024. The average paddy rice yield was 4.1 tons per hectare, in season A of 2025, with small scale farmers harvesting 2 tons per hectares and Large-Scale Farmers harvesting 4.1 tons per hectare.

In season B of 2025, the cultivated area for paddy rice was 17,970 hectares, a decrease of 0.1% from season B of 2024. The average paddy rice yield was 4.1 tons per hectare, with small scale farmers harvesting 2 tons per hectare and Large-Scale Farmers harvesting 4.1 tons per hectare (see district details in Tables 13-26).

Irish potatoes:

In season A of 2025, the cultivated area of Irish potatoes was estimated at 54,485 hectares in, an increase of 0.8 % from season A of 2024. The average Irish potato yield was 8.7 tons per hectare in season A of 2025, with small scale farmers harvesting 8.7 tons per hectares and Large-Scale Farmers harvesting 11.4 tons per hectare.

In season B of 2025, the cultivated area of Irish potatoes was estimated at 45,940 hectares, an increase of 9.8 % compared to the same season of 2024. The average yield of Irish potato was 6.8 tons per hectare, with small scale farmers harvesting 6.8 tons per hectares and Large-Scale Farmers harvesting 14.2 tons per hectare.

In season C of 2025, the cultivated area under Irish potatoes was estimated at 10,389 hectares, a decrease of 17% compared to the same season of 2024. The average

Sweet potato:

In season A of 2025, the cultivated area for sweet potato was at 82,458 hectares, a decrease of 13.8 % compared to the same season of 2024. The average yield of sweet potato was 8.4 tons per hectares.

In season B of 2025, sweet potato cultivated area was at 89,679 hectares, a decrease of 7.8 % from the corresponding season of 2024. The average yield of sweet potato was 8.1 tons per hectares.

In season C of 2025, sweet potato cultivated area was estimated at 4,539 hectares, an increase of 2% compared to the same season of 2024. The average yield was 9.1 tons per hectares in season C (see district details in Tables 13-26)

Cassava:

The cultivated area for cassava was estimated at 247,839 hectares in season A of 2025, representing a decrease of 1.3% from season A of 2024. The cultivated area in season B 2025, was estimated at 196,881 hectares, representing an increase of 14% from the corresponding season in 2024.

The harvested area was estimated at 40,090 hectares in season A of 2025 and 59,053 hectares in season B of 2025.

The average cassava yield was 13.5 tons per hectare in season A of 2025 and 14.4 tons per hectare in season B 2025. (see district details in Tables 13-26)

Banana:

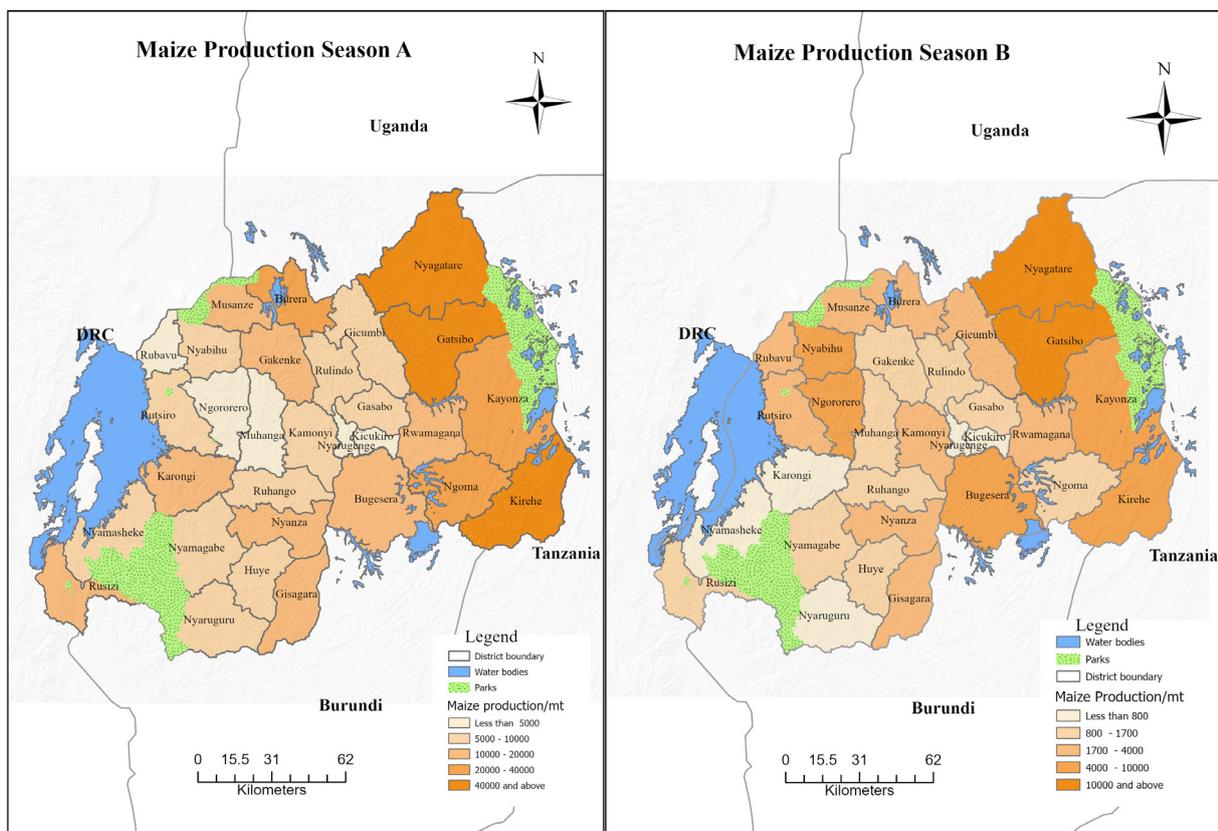

The cultivated area for banana was estimated at 268,552 hectares in season A of 2025, representing a 1.7% decrease from season A of 2024. The harvested area in Season A 2025 was estimated at 109,994 hectares. Similarly, in season B 2025, the cultivated area was estimated at 238,119 hectares, a decrease of 7.91% from the corresponding season in 2024, with the estimated harvested area of 93,803 hectares.

The average banana yield was 11.6 tons per hectare in season A 2025 and 12.4 tons per hectare in season B 2025. (See district details in Tables 13-26).

3.2.2 Production of major crops

Maize Production: The maize production was estimated at 481,246 metric tons in Season A of 2025 and 117,711 metric tons in Season B of 2025, representing a decrease of 5.3% and 1.2%, respectively, compared to the same seasons in 2024. In both seasons, the Eastern Province recorded the highest maize output, with consistently strong production in the districts of Nyagatare, Gatsibo, Kirehe, and Kayonza, as illustrated in Map 5 (see district-level details in Tables 24-26).

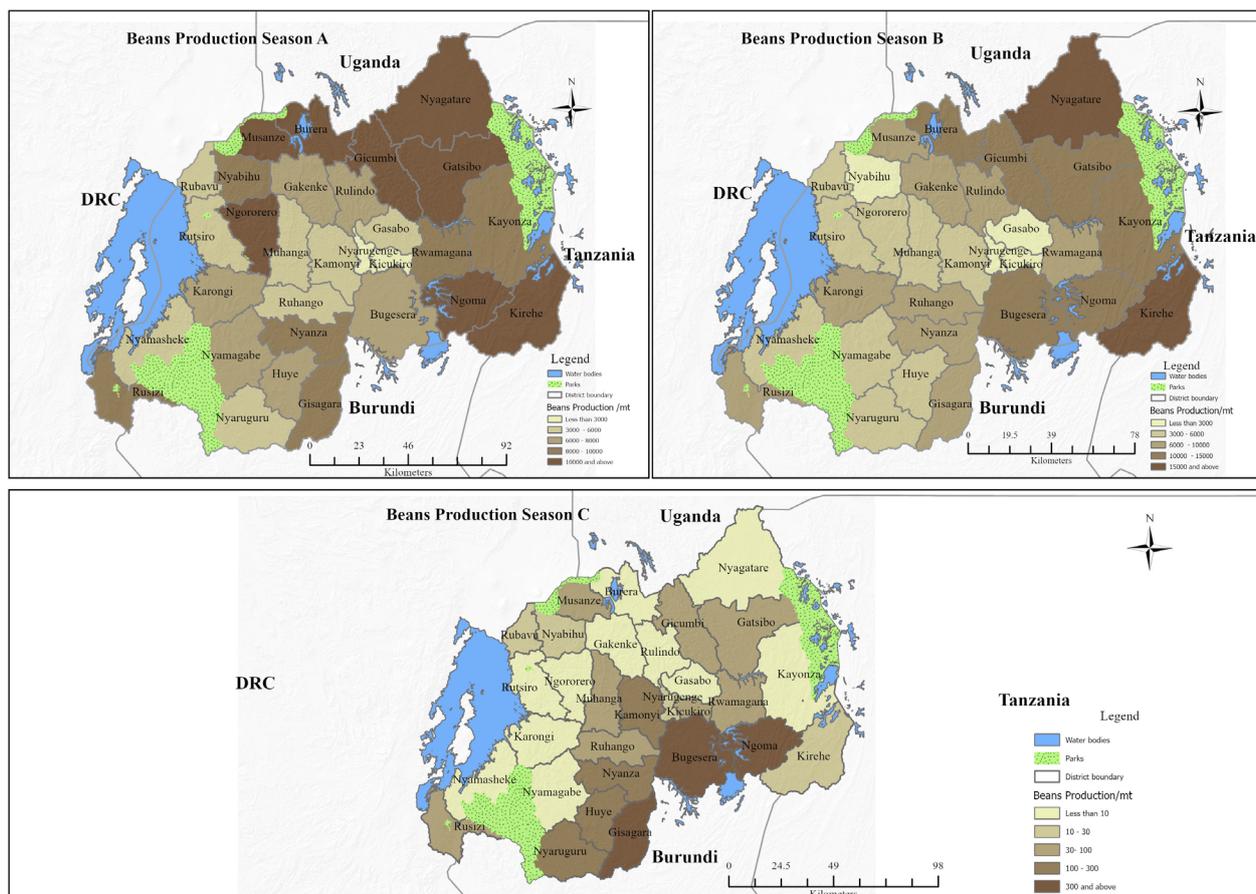

Map 5: Distribution of Maize Production by District in SAS 2025

Source: NISR, SAS 2025

Beans Production: In 2025, Beans Production was estimated at 230,456 metric tons in Season A, 240,721 metric tons in Season B, and 3,178 metric tons in Season C. This represents a decrease of 1.2% in Season A and a decrease of 0.6% in Season B compared to 2024. Conversely, Season C recorded an increase of 4%. Across the seasons, the highest-producing districts varied but consistently included key areas in the Eastern and Northern provinces. In Season A, the leading districts were Gatsibo, Gicumbi, Kirehe, and Ngoma. In Season B, the highest production was recorded in Nyagatare, Kirehe, Ngoma, Bugesera, Gicumbi, and Gatsibo. For Season C, the top-producing districts were Bugesera, Gisagara, and Ngoma. These trends are illustrated in Map 6 (see district-level details in Tables 24-26)

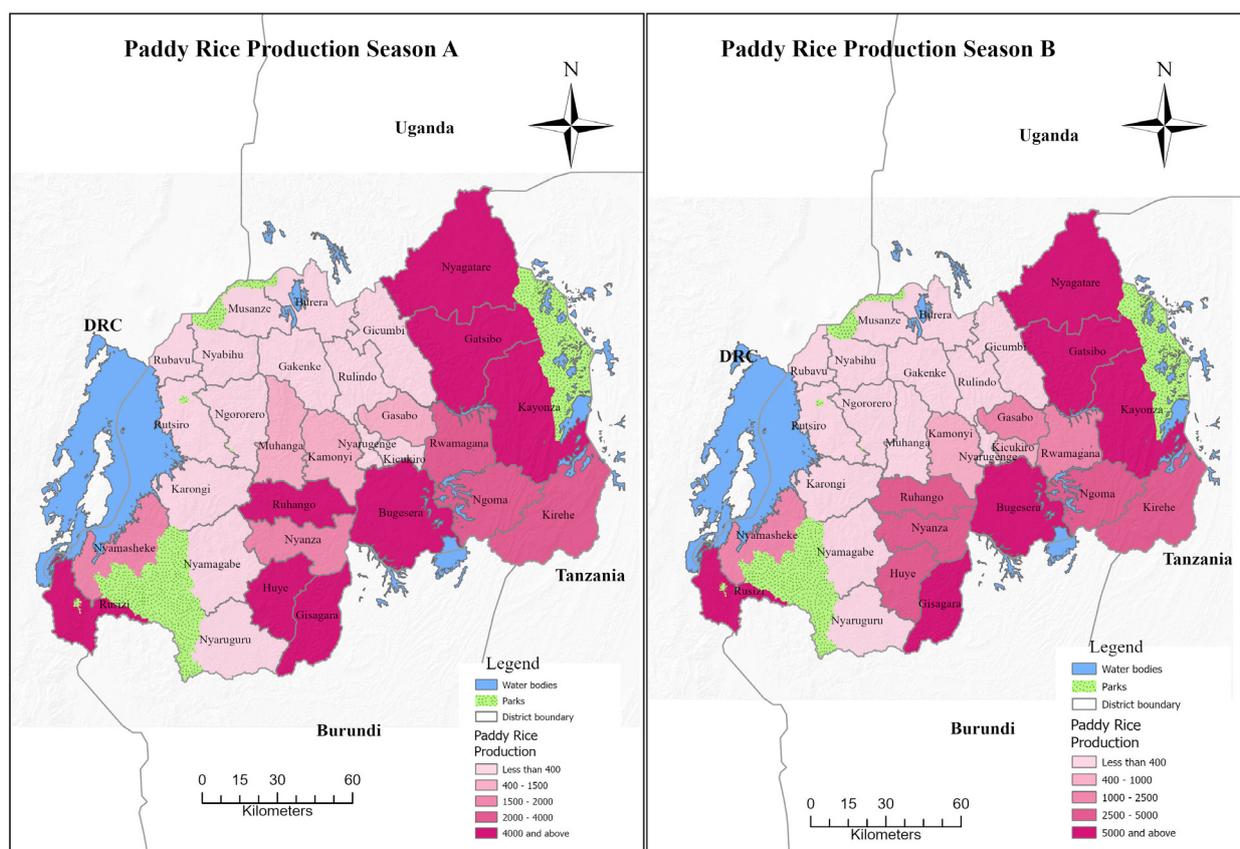

Map 6: Distribution of Beans Production by District in SAS 2025

Source: NISR, SAS 2025

Paddy rice Production: During 2025, Paddy rice production was estimated at 69,680 metric tons in Season A and 72,976 metric tons in Season B, reflecting increases of 0.8% and 0.2%, respectively, compared to the same seasons in 2024. Across both seasons, the highest production was consistently recorded in the districts of Nyagatare, Gisagara, Gatsibo, Bugesera, and Rusizi. These patterns are illustrated in Map 7 (see details in Tables 24-26).

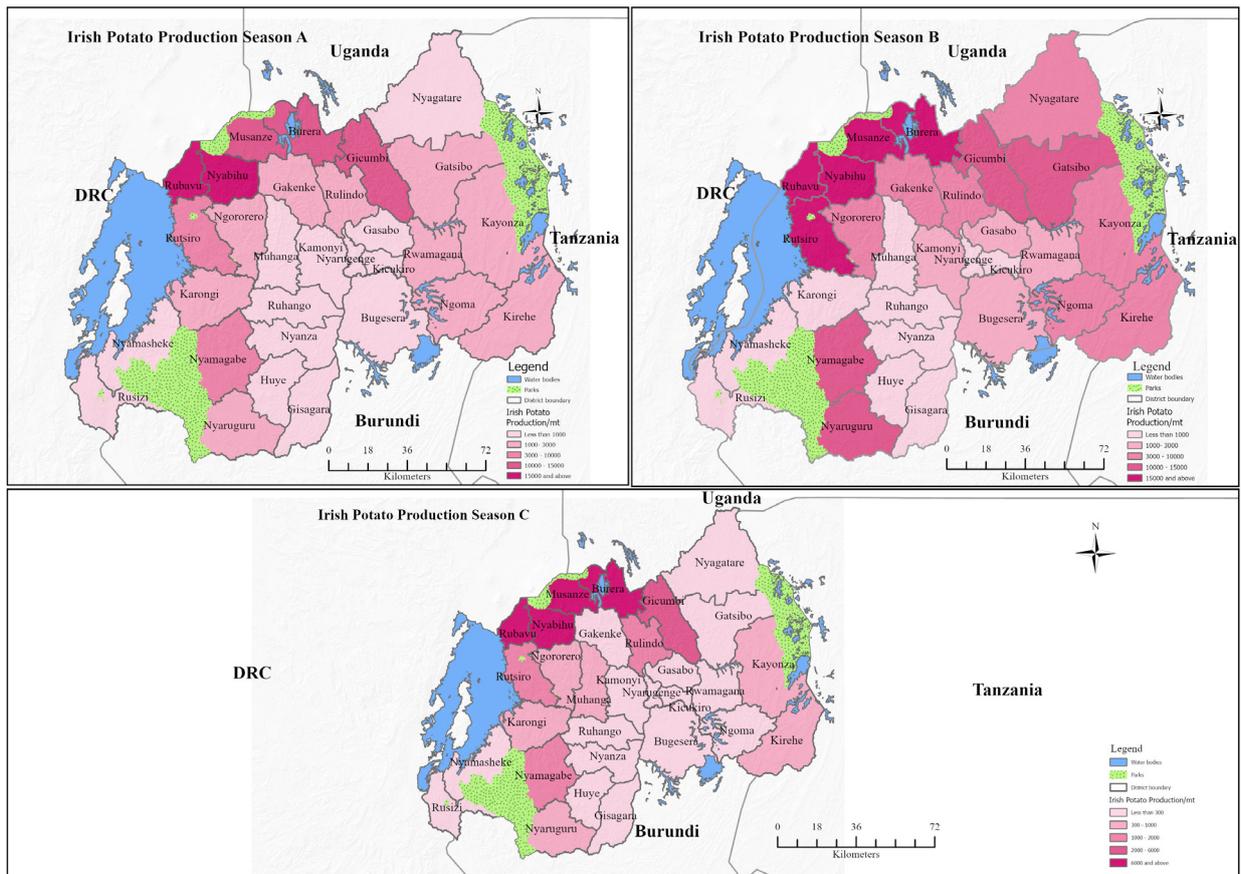

Map 7: Distribution of Paddy Rice Production by District in SAS 2025

Source: NISR, SAS 2025

Irish potato Production: In 2025, Irish potato production was estimated at 475,785 metric tons in Season A, 314,093 metric tons in Season B, and 94,892 metric tons in Season C. This represents increases of 3.2%, 10%, and 17%, respectively, compared to the corresponding seasons of 2024. Across all three seasons, the highest levels of Irish potato production were consistently recorded in the districts of Nyabihu, Rubavu, Musanze, and Burera. These spatial patterns are illustrated in Map 8 (see details in Tables 24-26).

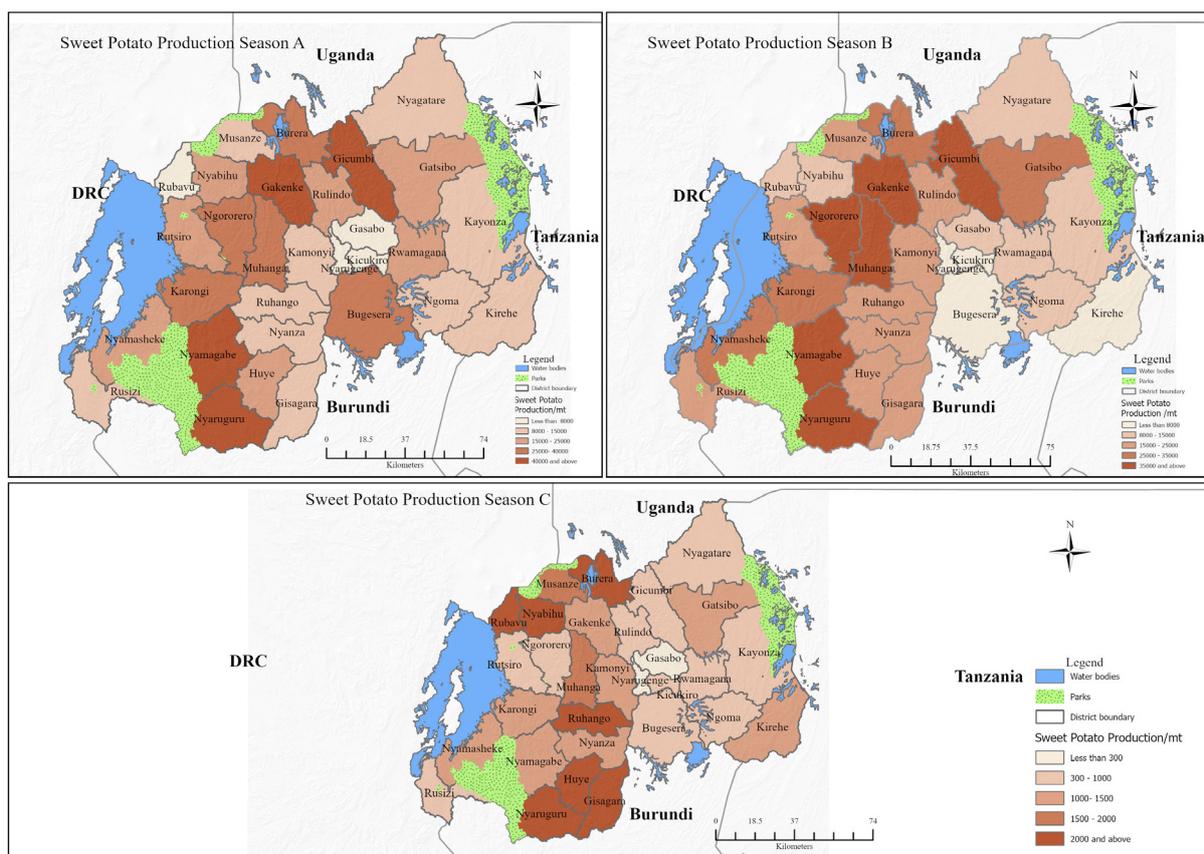

Map 8: Distribution of Irish Potato Production by District in SAS 2025

Source: NISR, SAS 2025

Sweet potato Production: In 2025, sweet potato production was estimated at 656,320 metric tons in Season A, 652,515 metric tons in Season B, and 41,289 metric tons in Season C. Compared to the corresponding seasons in 2024, this reflects a decrease of 5.3% for Season A and 2.1% for Season B. Conversely, Season C recorded an increase of 8%. The districts with the highest production varied seasonally. In Season A, the leading producers were Gicumbi, Gakenke, Nyamagabe, and Nyaruguru. In Season B, the leading districts were Nyamagabe, Gakenke, Nyaruguru, and Ngororero. For Season C, the highest production was recorded in Nyaruguru, Burera, Rubavu and Gisagara. These patterns are illustrated in Map 9 (see details in Tables 24-26).

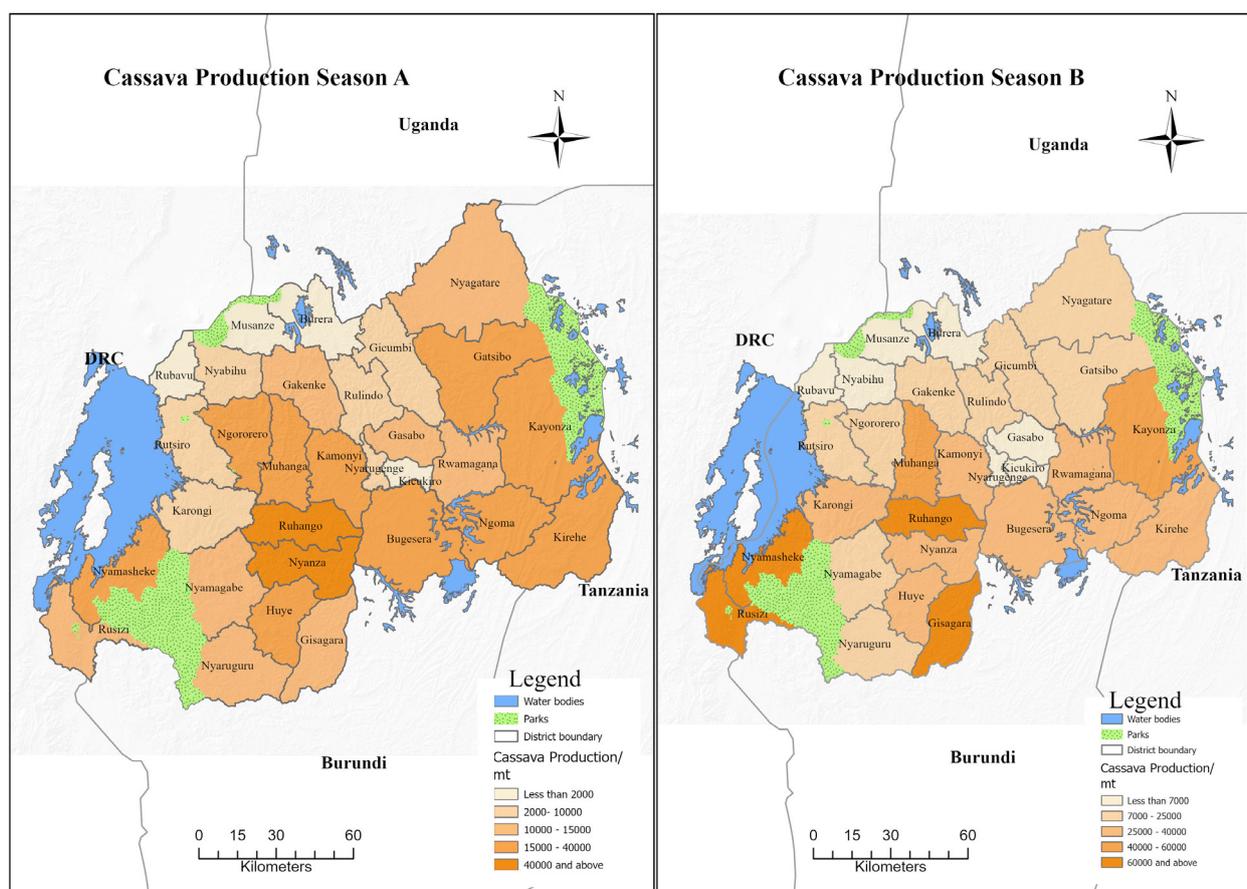

Map 9: Distribution of Sweet Potato Production by District in SAS 2025

Source: NISR, SAS 2025

Cassava Production: In 2025, cassava production was estimated at 542,874 metric tons in Season A and 852,541 metric tons in Season B, representing an increase of 4.8% and 8.8% respectively, compared to the same seasons in 2024. In Season A, the highest production was recorded in the districts of Ruhango, Nyanza, Ngoma, Kamonyi, and Kayonza, while in Season B the leading districts were Rusizi, Ruhango, Gisagara, Nyamasheke, and Kayonza. These spatial production patterns are illustrated in Map 10 (see details in Tables 24-26).

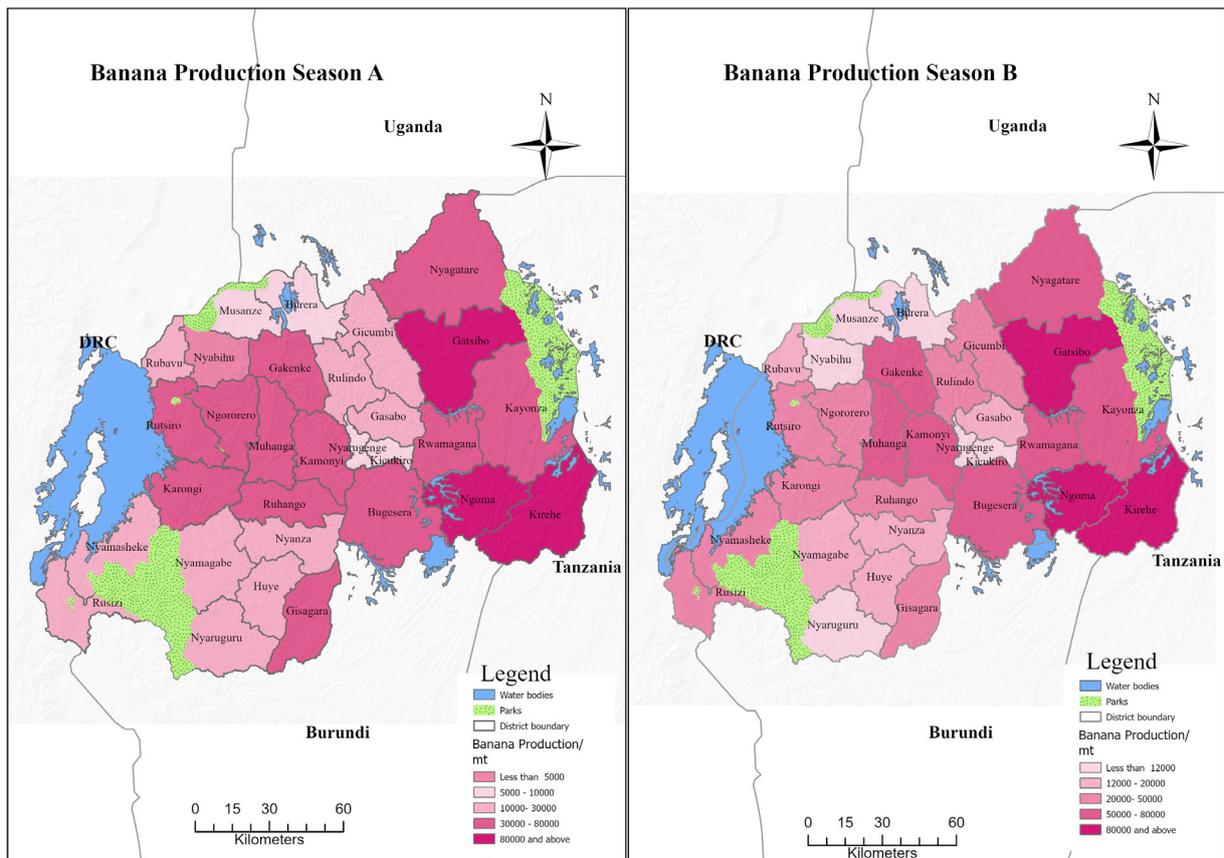

Map 10: Distribution of Cassava Production by District in SAS 2025

Source: NISR, SAS 2025

Banana Production: In 2025, banana production was estimated at 1,278,234 metric tons in Season A and 1,166,247 metric tons in Season B. This represents a 1.3% decrease from the corresponding season in 2024 for Season A and a 2.1% increase for Season B. For both seasons, the Eastern Province recorded the highest production levels, particularly in the districts of Gatsibo, Kirehe, Ngoma, and Nyagatare. These patterns are illustrated in Map 11, (see details in Tables 24-26).

Map 11: Distribution of Banana Production by District in SAS 2025

3.3. Agricultural inputs

This section highlights the use of agricultural inputs. Agricultural inputs include seeds, organic and inorganic fertilizers, and pesticides/fungicides. The survey results are presented in terms of percentage of farmers who applied such agricultural inputs throughout the agricultural year.

3.3.1. Use of seeds

Figure 2: Use of improved seeds (%)

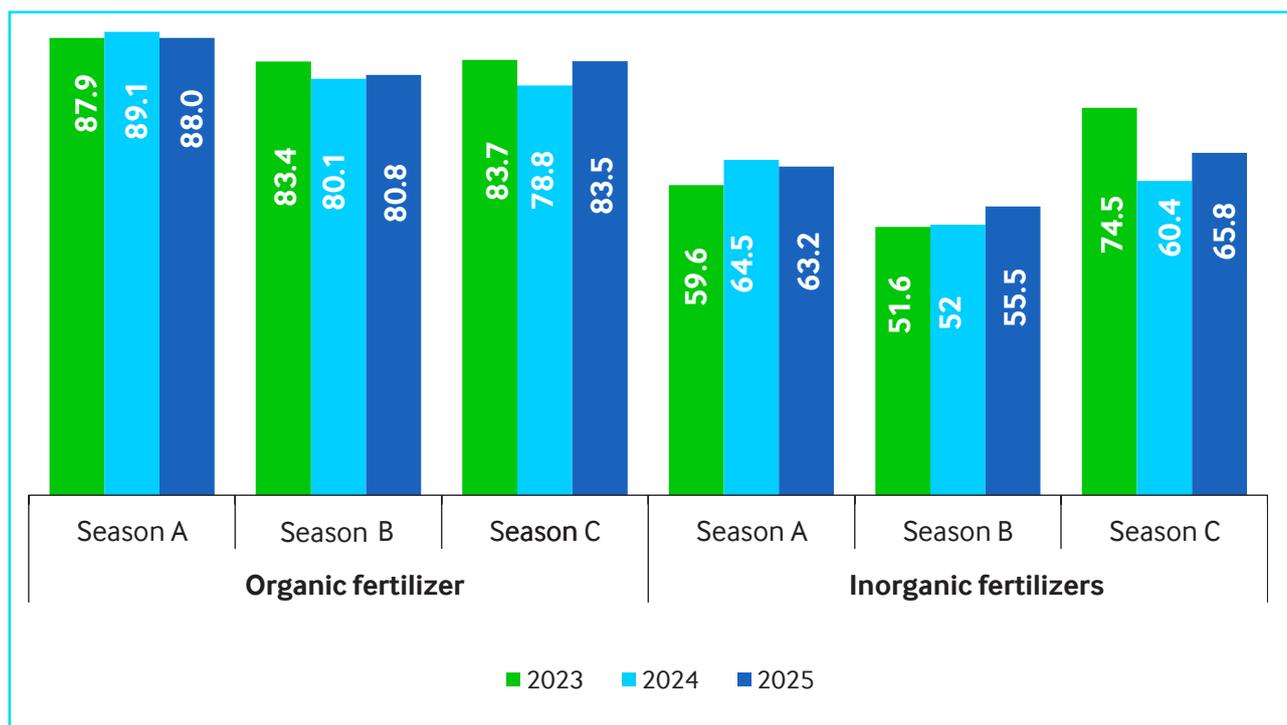

Source: NISR, SAS 2025

Figure 2 demonstrates that 37.3% of farmers used improved seeds in Season A of 2025 compared to 18% in Season B, and 18.9% in Season C. In terms of farmer categories, 35.9% of small-scale farmers (SSF) and 85.4% of large-scale farmers (LSF) reported improved seeds usage in season A. In season B 2025, 16.7% of small-scale farmers and 72.1% of large-scale farmers used improved seeds. NGOs/Companies and Agro-dealers were the primary sources for improved seeds across seasons of 2025. (See district details in table 33-42).

3.3.2. Use of fertilizers

Figure 3: Percentage of farmers who used fertilizers.

Source: NISR, SAS 2025

The application of organic fertilizers varied across the 2025 agricultural seasons. In season A, 88 % of farmers used organic fertilizers, with 88.3 % of small-scale farmers and 77.5% of large-scale farmers. In season B, 80.8 % of farmers reported organic fertilizers usage, with 81.2 % of small-scale farmers and 63.8 % of large-scale farmers. However, 83.5 % of farmers used organic fertilizers in season C of 2025.

The application of inorganic fertilizers varied across the 2025 agricultural seasons. In season A, 63.2 % of farmers used inorganic fertilizers with 62.4 % of small-scale farmers and 91.9 % of large-scale farmers. Usage in season B was reported by 55.5 % of farmers, with 54.8 % of small-scale farmers and 83.7 % of large-scale farmers applying fertilizers. In contrast, 65.8 % of farmers used inorganic fertilizers in season C of 2025. (See district details in table 44-57)

3.3.3. Use of pesticides

Figure 4: Percentage of farmers who used pesticides

Source: NISR, SAS 2025

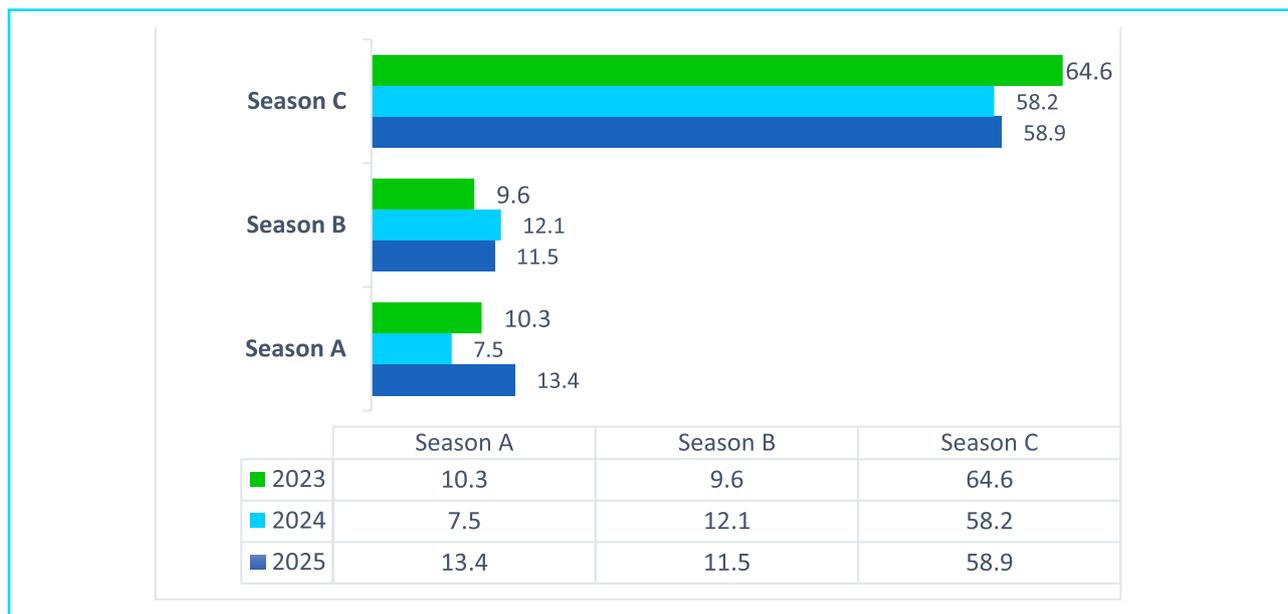

Pesticide application among farmers varied across the 2025 agricultural seasons. In Season A, 41.9% of farmers used pesticides, comprising 40.6% of small-scale farmers and 86.9% of large-scale farmers. Usage decreased to 36.6% in Season B, with 35.6% of small-scale farmers and 77.7% of large-scale farmers using pesticides. The highest pesticide usage was observed in Season C, where 67% of farmers reported pesticide use. (Detailed data are presented in Tables 58–63).

3.4. Agricultural practices

Agricultural practices assessed include irrigation, mechanisation, erosion control measures and agroforestry adopted by farmers during the SAS 2025. The results are presented in terms of the percentage of farmers who applied such practices.

3.4.1. Irrigation practices

Figure 5: Farmers who practiced irrigation (%)

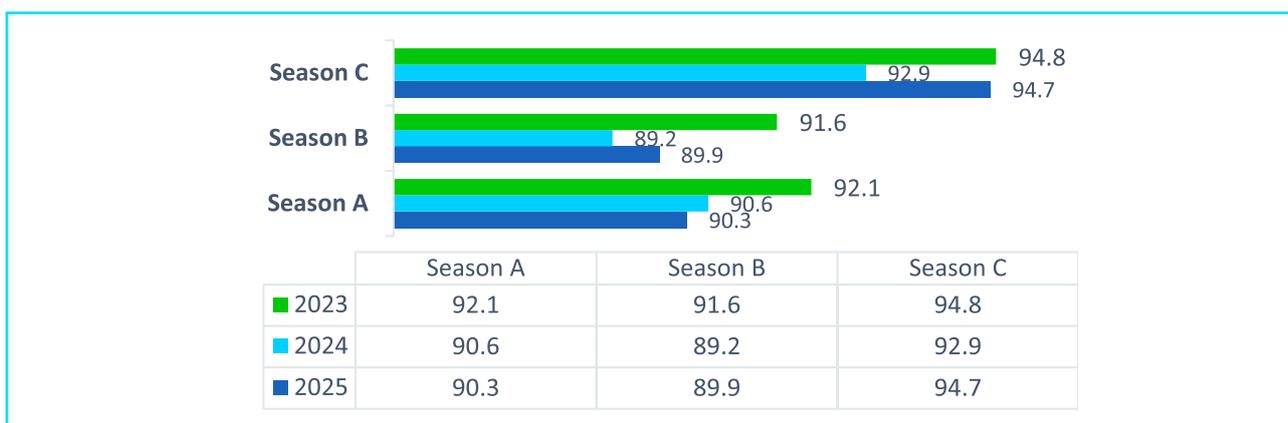

Source: NISR, SAS 2025

In season A of the 2025 agricultural year, irrigation was practiced by 13.4 % of farmers, compared to 11.5 % of farmers in season B and 58.9% in season C. During season A, irrigation was practiced by 12 % of small-scale farmers and 64.1 % for large-scale farmers, while in season B, irrigation was practiced by 10.3 % of small-scale farmers and 62% for large-scale farmers. Regarding the types of irrigation systems used, modern irrigation was practiced by 55.5 % of farmers in season A, and 59.3 % in season B. Conversely, traditional techniques were predominant during season C, utilized by 80% of farmers. (See details in Tables 64-75)

3.4.2. Erosion control measures

Figure 6: Farmers who protected land against erosion (%)

Source: NISR, SAS 2025

During the 2025 agricultural year the adoption of anti-erosion measures varied seasonally. In Season A, 90.3% of farmers applied anti-erosion activities, compared to 89.9% in Season B and 94.7% in Season C. The use of cover plants were the most prevalent anti-erosion method across all seasons, adopted by 56.7% of farmers in Season A, 56.4% in Season B, and 40.8% in Season C. Additionally, 46.2% of farmers practiced agroforestry in Season A, rising to 51% in Season B but dropping to 28% in Season C of 2025. In contrast, the use of mechanical equipment in agricultural activities remained minimal throughout the year. It was utilized by 0.9% of farmers in Season A, 0.7% in Season B, and 0.3% in Season C. (detailed data are presented in Tables 61–72).

3.5. Gross Value Added (GVA)

The Gross Value-Added value of different crops is demonstrated in constant 2017 prices. Results show the Gross Value Added per hectare for crops such as maize, paddy rice, beans and banana, have decreased in 2025 compared to 2024.

Table 8 : Main crops GVA in constant 2017 prices (Frw /ha)

Crops	2017	2018	2019	2020	2021	2022	2023	2024	2025

ANNEX

Annex 1: Concepts, definitions, and estimation methods

1. Total land area

Total land area at district level is the district area excluding area under inland water bodies. The definition of inland water bodies generally includes major rivers and lakes.

2. Agricultural area

The agricultural area includes arable land, land under permanent² crops and permanent pasture.

3. Arable land

Arable land includes land defined by the FAO as land under temporary crops (double-cropped areas are counted only once), temporary meadows for mowing or pasture, land under market and kitchen gardens and land temporarily fallow (less than five years). The abandoned land resulting from shifting cultivation is not included in this category. Data for arable land are not meant to indicate the amount of land that is potentially cultivable.

4. Permanent crop land

Permanent crops are sown or planted once and occupy the land for some years and do not need to be replanted after each annual harvest, such as cocoa, coffee and rubber. This category includes flowering shrubs, fruit trees, nut trees and vines, but excludes trees grown for wood or timber. The following crops are considered as permanent crops in SAS: Cooking banana, Dessert banana, Banana for beer, Avocado, Coffee, Sugar cane, Macadamia, Olive, Mango, Apple, Papaya, Orange, Lemon, Guava, Mulberry, Stevia, Jatropha, Palm, and Tea.

5. Permanent pasture land

Land used permanently (five years or more) for herbaceous forage crops, either cultivated or growing wild (wild prairie or grazing land).

6. Irrigated agricultural land

Area equipped for irrigation, which is actually irrigated, (sometimes expressed as a percentage of the total land area). Part of the area equipped for irrigation refers to area equipped to provide water to crops and includes areas equipped for full/partial control irrigation, equipped lowland areas, and areas equipped for spate irrigation. Part of the area equipped for irrigation which is irrigated refers to physical areas. Irrigated land that is cultivated more than once a year is counted only once.

7. Physical area

Physical area refers to the total area of the plot as physically measured. The physical agricultural area in a district is estimated by aggregating all weighted individual agricultural plots area for that district.

² For some plots, permanent crops are mixed with temporary crops which mean that same area is counted in both arable land area and area under permanent crop.

8. Crop area (cultivated area)

Crop area refers to the area occupied by a given crop in a plot considering its density or occupation. In context of Rwanda as well as many African countries, mixed cropping system is a general practice in agriculture. This practice makes it complex to estimate area under crop cultivation. In case of pure stands (for crop completely covering a plot), crop area is equal or less to physical plot area (if a crop is partially covering the plot, the share is estimated then applied to the plot area). In case of mixed crops, the share of each crop in the plot is estimated by enumerator by eye estimation method and applied to the physical area of the plot to obtain area for each specific crop planted in plot. In this context, the crop share is eye estimation of crop density or occupation in a plot (in %) basing on spacing between plants. Cultivated area at district level is equal to the total weighted crop areas within plots in the whole district.

Examples

- In case of pure stands, crop area will be equal to the physical area if the crop entirely covers the whole plot. Otherwise, the crop area will be less than physical area. For example, a plot of 1 hectare in which maize was grown and completely occupies the whole plot (100 % occupied), it means that cultivated area for maize is 1 hectare. On the other side let us assume that the maize crop occupies 80 % of the total plot area. In that case the area of maize equals 0.8 hectares (1 hectare times 0.8).
- In case of mixed cropping system, specifically seasonal crops the crop area is less than physical area. For example, a plot of 1 hectare grown with maize and beans which occupies 60 % and 40 % of total plot area respectively. The maize area will be 0.6 hectare (1 hectare times 0.6), and beans area will be 0.4 (1 hectare times 0.4). It is important to note that sum of shares of seasonal crops do not exceed one hundred percent.
- When seasonal and perennial crops are mixed in same plot, since perennial crops are permanent crops in nature, their shares are treated separately from seasonal crops. The sum of seasonal crops share does not exceed 100 %, while for perennial crops shares are given based on density (spacing between trees) and it may exceed 100 percent. For example, a plot of 1 hectare grown with maize, bean, and cassava with 60 %, 40 % and 50% shares respectively. Maize area will be 0.6 hectare (1 hectare times 0.6), beans area will be 0.4 (1 hectare times 0.4), while cassava area will be 0.5 hectare (1 hectare times 0.5).

9. Developed area

Developed area is the land covered by crops. Due to mixed cropping (over exploitation of agriculture land or under exploitation in case pure cropping), developed area can be less or greater than the physical area. Basing on the example provided above of the plot in which maize, beans and cassava have been mixed, maize has 0.6, beans have 0.4 while cassava has 0.5 ha. The developed area equals the sum of the crops area equivalent to 1.5 ha.

10. Harvested area

Area harvested is defined as the total number of hectares for all crops that is harvested in a given agriculture season. In case of crops considered as seasonal, the harvested area is assumed to be equal to the cultivated area. For perennial crops a farmer can decide to harvest a portion of land and stores the remaining production in the farm or harvest the whole plot for commercial or other purposes. In this case, the proportion of harvested area is estimated and applied to the plot area to obtain actual harvested area. For example, cassava which occupies 0.5 hectare has 5,000 trees of cassava. In agriculture Season B, if the farmer only harvested 1,250 trees. In this case, the farmer harvested only a quarter (0.125 hectares) of the cultivated area.

11. Crop yield

Crop yield is defined as total reported quantity of harvested crop over the harvested area of that crop.

12. Crop production

Crop production is the product of crop yield and crop area (harvested). At district level, crop production is estimated by taking crop yield of crop produce times total harvested area in the district

Annex 2: NISR STAFF WHO CONTRIBUTED TO SEASONAL AGRICULTURE SURVEY 2025

National Coordinators

- MURENZI Ivan, Director General
- MWIZERWA Jean Claude, Deputy Director General

Technical coordination

- SIBOMANA Oscar, Acting Director of Economic Statistics Department
- BIGIRIMANA Florent, Census Program Manager
- DUSINGIZIMANA Emmanuel, Agriculture and Environmental Statistician Team Leader
- NIYITEGEKA Beata, GIS Team Leader

Field work coordination

- KAMANZI SHINGIRO Jean Philbert, SAS Specialist
- MUKAMAZIMPAKA Francine, Perennial crops and horticulture statistician
- BYUKUSENGE Josiane, Seasonal Crop Production Statistician
- SINDIKUBWABO Ezechias, Livestock and Fisheries Production Statistician
- INEZA Belise, SAS Support Staff

Data analysis

- ABAYISENGA Aimable, SAS Specialist
- RWAYITARE Jean Bosco, SAS Specialist
- MUREBWAYIRE Divine, SAS Specialist
- USABYIMANA Monique, Forestry and Environmental Statistician

GIS

- IRAMBONA Eddy Marcus, GIS Specialist
- MUNDERERE Theophile, GIS Specialist
- BIZIMUNGU Clément, Field operations Cartographer Officer
- KARERA Albert, Geometrician in charge of map design & production
- NYIRIMANZI Louis Maxime, Spatial database Geometrician
- NDAZIGARUYE Alfred, GIS Support Staff
- NGABO MUHIRE Olympe, GIS Support Staff

Data processing

- SEBAHIRE Jean Népomuscène, Food Security & Agriculture Surveys Data Processing Officer
- NIYIGENA Eric, Application Admin and Data Processing Officer
- ISHIMWE Eugénie, IT Support Staff

Report writing and editing

- RWAYITARE Jean Bosco, SAS Specialist
- DUSINGIZIMANA Emmanuel, Agriculture and Environmental Statistician Team Leader

Proofreading

- KALISA NEEMA Grace, Communication Specialist

Layout, Typesetting & Designing

- UWAMUNGU Thierry, Publication Specialist
- Amani Sylvestre, Communication Designer
- Byukusenge Josiane, Statistician
- Kagoyire Delphine, Communication Designer
